Mitobronitol is 1,6-dibromo-1,6-dideoxy-D-mannitol. It contains not less than 98.5% and not more than 101.0% of $C_6H_{12}Br_2O_4$ calculated with reference to the dried substance.

CHARACTERISTICS

A white or almost white, crystalline solid.

Slightly soluble in *water*, in *acetone* and in *ethanol (96%)*.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of mitobronitol *(RS 236)*.

B. Dissolve 0.1 g in 10 ml of 1M *sodium hydroxide*, boil, cool, acidify with 2M *nitric acid* and add 1 ml of *silver nitrate solution*. A pale yellow, curdy precipitate is produced.

C. Dissolve 20 mg in 2 ml of a mixture of 1 volume of *periodic acid solution* and 24 volumes of *water*. Add 1 ml of 0.25M *barium chloride* and shake well. A white, flocculent precipitate is produced.

TESTS

Acidity

Shake 2 g with 50 ml of *carbon dioxide-free water* for 15 minutes and filter. 40 ml of the filtrate requires not more than 0.3 ml of 0.02M *sodium hydroxide VS* for neutralisation using *phenolphthalein solution R1* as indicator.

Clarity and colour of solution

A 4.0% w/v solution in *dimethylformamide* is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method I.

Heavy metals

1.0 g complies with *limit test C for heavy metals*, Appendix VII (20 ppm). Use 2 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Ionic halide

Shake 0.20 g with 30 ml of *water* for 5 minutes and filter. 15 ml of the filtrate complies with the *limit test for chlorides*, Appendix VII (500 ppm, calculated as Cl).

Loss on drying

When dried at 105° for 2 hours, loses not more than 1.0% of its weight. Use 1 g.

Sulphated ash

Not more than 0.2%, Appendix IX A.

ASSAY

Dissolve 0.2 g in 20 ml of 1M *sodium hydroxide* by heating gently, cool, add 25 ml of 0.1M *silver nitrate VS* and acidify with 5 ml of 5M *nitric acid*. Add 2 ml of *ammonium iron(III) sulphate solution R2* and titrate the excess of silver nitrate with 0.1M *ammonium thiocyanate VS*. Each ml of 0.1M *silver nitrate VS* is equivalent to 15.40 mg of $C_6H_{12}Br_2O_4$.

STORAGE

Mitobronitol should be protected from light.

Minimum 0.7 × 10^7 IU per milligram of protein.

PRODUCTION

Molgramostim concentrated solution is produced by a method based on recombinant DNA (rDNA) technology, using bacteria as host cells. It is produced under conditions designed to minimise microbial contamination of the product.

Prior to release, the following tests are carried out on each batch of the final bulk product, unless exemption has been granted by the competent authority.

Host-cell derived proteins

The limit is approved by the competent authority.

Host-cell or vector derived DNA

The limit is approved by the competent authority.

Test solution Dilute the preparation to be examined with *water R* to obtain a concentration of 0.25 mg/ml.

Reference solution (a) Dilute *molgramostim CRS* with *water R* to obtain a concentration of 0.25 mg/ml.

Reference solution (b) Use an isoelectric point (pI) calibration solution, in the pI range of 2.5-6.5, prepared according to the manufacturer's instructions.

Focusing:

— *pH gradient*: 4.0-6.5;

— *catholyte*: 8.91 g/l (0.1 M) solution of β*-alanine R*;

— *anolyte*: 14.7 g/l (0.1 M) solution of *glutamic acid R* in a 50 per cent *V/V* solution of *dilute phosphoric acid R* (0.5 M);

Transfer the gel to a mixture of 32 volumes of *glacial acetic acid R,* 100 volumes of *ethanol R* and 268 volumes of *water R* (mixture A) and rinse for 5 min. Immerse the gel for 10 min in a staining solution prewarmed to 60 °C and prepared by adding *brilliant blue R* at a concentration of 1.2 g/l to mixture A. Wash the gel in several containers with mixture A and keep the gel in this mixture until the background is clear (12-24 h). After adequate destaining, soak the gel for 1 h in a 10 per cent *V/V* solution of *glycerol R* in mixture A.

System suitability:

— in the electropherogram obtained with reference solution (b), the relevant isoelectric point markers are distributed along the entire length of the gel,

— in the electropherogram obtained with reference solution (a), the pI of the principal band is 4.9 to 5.4.

Results The principal band in the electropherogram obtained with the test solution corresponds in position to the principal band in the electropherogram obtained with reference solution (a). Plot the migration distances of the relevant pI markers versus their pI and determine the isoelectric points of the principal component of each of the test solution and reference solution (a). They do not differ by more than 0.2 pI units.

C. Examine the electropherograms obtained under reducing conditions in the test for impurities with molecular masses differing from that of molgramostim. The principal band in the electropherogram obtained with test solution (a) is similar in position to the principal band in the electropherogram obtained with reference solution (a).

Place the capped tube in boiling water for 1 min. Cool to room temperature.

Reference solution Prepare at the same time and in the same manner as for the test solution but use *molgramostim CRS* instead of the preparation to be examined.

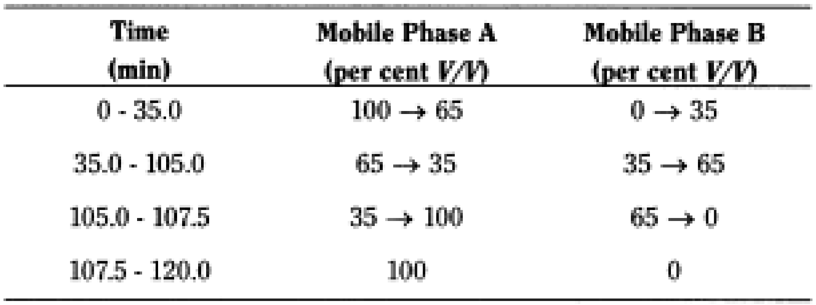
— *mobile phase B*: dilute 1 ml of *trifluoroacetic acid R* in 100 ml of *water R*; add 900 ml of *acetonitrile for chromatography R* and mix;



Time (min)	Mobile Phase A (per cent *V/V*)	Mobile Phase B (per cent *V/V*)
0 - 35.0	100 → 65	0 → 35
35.0 - 105.0	65 → 35	35 → 65

E. *N*-Terminal sequence analysis.

Perform the Edman degradation using an automated solid-phase sequencer, operated in accordance with the manufacturer's instructions.

Load about 1 nmol of the test preparation to a sequencing cartridge using the protocol provided by the manufacturer. Run 16 sequencing cycles, noting, if appropriate, the presence of proline at positions 2, 6, 8 and 12.

Identify the phenylthiohydantoin (PTH)-amino acids released at each sequencing cycle by reverse-phase liquid chromatography. The procedure may be carried out using the column and reagents recommended by the manufacturer of the sequencing equipment for the separation of PTH-amino acids.

The separation procedure is calibrated using:

— the mixture of PTH-amino acids provided by the manufacturer of the sequencer, with the gradient conditions adjusted as indicated to achieve optimum resolution of all amino acids;

— a sample obtained from a blank sequencing cycle obtained as recommended by the equipment manufacturer.

Results The first 16 amino acids are: Ala-Pro-Ala-Arg-Ser-Pro-Ser-Pro-Ser-Thr-Gln-Pro-Trp-Glu-His-Val.

Detection Silver staining as described below.

Immerse the gel overnight in a mixture of 10 volumes of *acetic acid R*, 40 volumes of *water R* and 50 volumes of *methanol R*. Transfer the gel to a 100 g/l solution of *glutaraldehyde R* and shake for about 30 min. Replace the glutaraldehyde solution with *water R*, and keep the gel in *water R* for 20 min. Repeat this washing-step twice. Transfer the gel to a mixture containing 0.75 g/l of *sodium hydroxide R*, 14 g/l of *concentrated ammonia R* and 8 g/l of *silver nitrate R*. This solution is prepared immediately before use. Place the gel on a shaker in the dark for 5 min. Wash the gel for 30 s in each of 3 containers with *water R* and shake the gel in a mixture consisting of 0.05 g/l of *citric acid R*, 0.05 per cent *V/V* of *formaldehyde R* and 0.005 per cent *V/V* of *methanol R* in *water R*. Protein bands become visible during this step. Keep the gel in the solution until sufficiently stained and then rinse the gel repeatedly with *water R* in a shaking water bath. Soak gels in a solution consisting of 10 per cent *V/V* of *acetic acid R* and 1 per cent *V/V* of *glycerol R*.

System suitability:

— the validation criteria are met (*2.2.31*);

— a band is seen in the electropherogram obtained with test solution (h);

— a gradation of intensity of staining is seen in the electropherograms obtained with test solutions (a)-(h) and (i)-(p);

— the molecular mass of the principal band in the electrophoregram obtained with reference solution (a) or (b) is within the range of 15 100 to 17 100.

Limits Compare the staining intensity of each non-molgramostim band observed in the electropherogram obtained with test solution (a) to the staining intensity of the principal band in the electropherograms obtained with test solutions (b)-(h). Proceed similarly with the electropherograms obtained with test solutions (i)-(p). The impurity level is estimated as the dilution, in percentage, of the solution giving the electropherogram with the closest intensity of staining.

Calculate the content of molgramostim using the declared content of molgramostim in *molgramostim CRS.*

Potency

Determination of the biological activity of molgramostim concentrated solution based on the stimulation of proliferation of TF-1 cells by molgramostim.

The following method uses the conversion of tetrazolium bromide (MTT) as a staining method. Validated alternative stains such as Almar blue have also been found suitable.

TF-1 cells are incubated with varying dilutions of test and reference preparations of molgramostim. They are then incubated with a solution of MTT. This cytochemical stain is converted by cellular dehydrogenases to a purple formazan product. The formazan is then measured spectrophotometrically. The potency of the preparation to be examined is determined by comparison of the dilutions of the test preparation with the dilutions of the appropriate International Standard of molgramostim or with a reference preparation calibrated in International Units, which yield the same response (50 per cent maximal stimulation).

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Add 50 µl of dilution medium to all wells of a 96-well microtitre plate. Add an additional 50 µl of this solution to the wells designed for the blanks. Add 50 µl of each solution to be tested in triplicate (test preparation and reference preparation at a concentration of about 65 IU/ml, plus a series of 10 twofold dilutions to obtain a standard curve). Then add to each well 50 µl of a TF-1 cell suspension containing 3×10^5 cells per millilitre, maintaining the cells in a uniform suspension during addition.

Incubate the plate at 36.0-38.0 °C for a minimum of 24 h in a humidified incubator using 6 ± 1 per cent CO_2. Add 25 µl of a 5.0 g/l sterile solution of *tetrazolium bromide R* to each well. Reincubate for 5 h. Remove the plates from the incubator and add to each well 100 µl of a 240 g/l solution of *sodium dodecyl sulphate R* previously adjusted to pH 2.7 with hydrochloric acid. Reincubate overnight.

Determine the relative quantity of purple formazan product formed in each well by measuring the absorbance (*2.2.25*) using a 96-well microtitre plate reader. Read each plate at 570 nm and at 690 nm. Subtract the reading at 690 nm from the reading at 570 nm. Analyse the data by fitting a sigmoidal dose-response curve to the data obtained and by using a suitable statistical method, for example the 4-parameter model (see *5.3*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 74 per cent and not more than 136 per cent of the stated potency.

Ph Eur

Low-Oxygen Nitrogen

General Notices

(Nitrogen, Low-Oxygen, Ph Eur monograph 1685)

N_2 28.01

DEFINITION

This monograph applies to nitrogen which is used for inerting finished medicinal products which are particularly sensitive to degradation by oxygen. It does not necessarily apply to nitrogen used in earlier production steps.

Content

Minimum 99.5 per cent *V/V* of N_2, calculated by deduction of the sum of impurities found when performing the test for impurities.

CHARACTERS

Colourless and odourless gas.

Solubility

At 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 62 volumes of water and about 10 volumes of alcohol.

PRODUCTION

Oxygen

Maximum 5 ppm *V/V*, determined using an oxygen analyser with a detector scale ranging from 0 ppm *V/V* to 100 ppm *V/V* and equipped with an electrochemical cell.

The gas to be examined passes through a detection cell containing an aqueous solution of an electrolyte, generally potassium hydroxide. The presence of oxygen in the gas to be examined produces variation in the electric signal recorded at the outlet of the cell that is proportional to the oxygen content.

Calibrate the analyser according to the manufacturer's instructions. Pass the gas to be examined through the analyser using a suitable pressure regulator and airtight metal tubes and operating at the prescribed flow rates until constant readings are obtained.

Impurities

Gas chromatography (*2.2.28*).

Gas to be examined The substance to be examined.

Reference gas (a) Use ambient air.

Reference gas (b) Use *nitrogen R1* .

Column:

- *material*: stainless steel;
- *size: l* = 2 m, Ø = 2 mm;
- *stationary phase*: appropriate molecular sieve for chromatography (0.5 nm).

Carrier gas *helium for chromatography R*.

Flow rate 40 ml/min.

Temperature:

- *column*: 50 °C;
- *detector*: 130 °C.

Detection Thermal conductivity.

System suitability Reference gas (a): adjust the injected volumes and operating conditions so that the height of the peak due to nitrogen in the chromatogram obtained is at least 35 per cent of the full scale of the recorder:

- the chromatogram obtained shows a clear separation of oxygen and nitrogen.

Limit:

- *total*: not more than 0.5 per cent of the sum of the areas of all the peaks (0.5 per cent *V/V*).

IDENTIFICATION

First identification *A*.

Second identification *B, C*.

A. Examine the chromatograms obtained in the test for impurities (see Production).

Results The principal peak in the chromatogram obtained with the gas to be examined is similar in retention time to the principal peak in the chromatogram obtained with reference gas (b).

B. In a 250 ml conical flask replace the air by the gas to be examined. Place a burning or glowing splinter of wood in the flask. The splinter is extinguished.

C. In a suitable test tube, place 0.1 g of *magnesium R* in turnings. Close the tube with a two-hole stopper fitted with a glass tube reaching about 1 cm above the turnings. Pass the gas to be examined through the glass tube for 1 min without heating, then for 15 min while heating the test tube to a red glow. After cooling, add 5 ml of *dilute sodium hydroxide solution R*. The evolving vapours turn the colour of moistened *red litmus paper R* blue.

STORAGE

Where the gas has to be stored, store as a compressed gas or a liquid in appropriate containers complying with the legal regulations.

Action and use

Low molecular weight heparin.

Ph Eur

DEFINITION

Nadroparin calcium is the calcium salt of low-molecular-mass heparin obtained by nitrous acid depolymerisation of heparin from pork intestinal mucosa, followed by fractionation to eliminate selectively most of the chains with a molecular mass lower than 2000. The majority of the components have a 2-*O*-sulpho-α-L-idopyranosuronic acid structure at the non-reducing end and a 6-*O*-sulpho-2,5-anhydro-D-mannitol structure at the reducing end of their chain.

Nadroparin calcium complies with the monograph Low-molecular-mass heparins (0828) with the modifications and additional requirements below.

The mass-average relative molecular mass ranges between 3600 and 5000 with a characteristic value of about 4300.

The degree of sulphatation is about 2 per disaccharide unit.

The potency is not less than 95 IU and not more than 130 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 2.5 and 4.0.

IDENTIFICATION

Carry out identification test A as described in the monograph *Low-molecular-mass heparins (0828)* using *nadroparin calcium CRS*.

Carry out identification test C as described in the monograph *Low-molecular-mass heparins (0828)*. The following requirements apply.

The mass-average relative molecular mass ranges between 3600 and 5000. The mass percentage of chains lower than 2000 is not more than 15 per cent. The mass percentage of chains between 2000 and 8000 ranges between 75 per cent and 95 per cent. The mass percentage of chains between 2000 and 4000 ranges between 35 per cent and 55 per cent.

TESTS

Appearance of solution

Dissolve 0.5 g of the substance to be examined in 10 ml of *water R*. The solution is not more intensely opalescent than the reference suspension II (*2.2.1*) and not more intensely coloured than the reference solution Y_5 (*2.2.2, Method II*).

Ethanol

Not more than 1.0 per cent *m/m*, determined by head-space gas chromatography (*2.2.28*), using *2-propanol R* as the internal standard.

Internal standard solution Dilute 1.0 ml of *2-propanol R* to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Reference solution Dilute 1.0 ml of *ethanol R* to 100.0 ml with *water R*. Dilute 0.5 ml of this solution to 20.0 ml with *water R*.

Vial filling Place the following into 4 separate vials which can be crimp-sealed and which are compatible with the injection system:

— 1.0 ml of *water R* (blank vial);

— 0.50 ml of the reference solution and 0.50 ml of the internal standard solution (reference vial);

— 10.0 mg of the substance to be examined. Add 1.0 ml of *water R* (test vial A);

— 10.0 mg of the substance to be examined. Add 0.50 ml of *water R* and 0.50 ml of the internal standard solution (test vial B).

The chromatographic procedure may be carried out using:

— a nickel column 1.5 m long and 2 mm in internal diameter packed with *ethylvinylbenzene divinylbenzene copolymer R* (150 µm to 180 µm);

— *helium for chromatography R* or *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min;

— a flame-ionisation detector.

Maintain the temperature of the column at 150 °C and those of the injection port and the detector at 250 °C.

Equilibrate each vial in the head-space system at 90 °C for 15 min. The pre-injection pressurisation time is 1 min.

The chromatogram obtained with the reference vial shows 2 peaks which correspond in order of increasing retention time to ethanol and 2-propanol (with retention times of approximately 2.5 min and 4 min). Calculate the content of ethanol (*m/m*) taking its density at 20 °C to be 0.792 g/ml.

N-NO groups

Not more than 0.25 ppm, determined by cleavage of the N-NO bond with hydrobromic acid in ethyl acetate under a reflux condenser and detection of the released NO by chemiluminescence.

Description of the apparatus (Figure 1134-1) Use a 500 ml borosilicate glass round-bottomed flask, above which is attached a condenser which is equipped with:

— on one side, a torion joint through which a stream of *argon R* can be introduced via a cannula;

— on the other side, a screw joint with a piston equipped with a septum through which the reference solution and test solution will be injected.

The round-bottomed flask is connected in series to 3 bubble traps which are themselves connected to 2 cold traps, which are in turn connected to a chemiluminescence detector. Suitable tubing ensures the junctions are leak-free.

Figure 1134.-1. – *Apparatus used for the assay of N-NO groups*

Preparation of the chemiluminescence detector Switch on the chemiluminescence detector 48 h before use and start the vacuum pump. The vacuum must be less than 0.5 mm Hg. 1 h before use, open the oxygen valve at a pressure of 0.2 MPa and a flow rate of 9.4 ml/min.

Preparation of the bubble trap In each bubble trap, place 30 ml of a 300 g/l solution of *sodium hydroxide R* in *water R*.

Preparation of the cold traps

— Trap at - 120 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 ml of *ethanol R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.

— Trap at - 160 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 ml of *2-methylbutane R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.

Drying of the 500 ml borosilicate-glass round-bottomed flask and condenser Boil 50 ml of *ethyl acetate R* under reflux for 1 h under *argon R* without connecting the system to the chemiluminescence detector.

Test solution Dry the substance to be examined for 12 h over *diphosphorus pentoxide R* at 60 °C under vacuum. Dissolve 0.10 g of the treated substance to be examined in 1.0 ml of *treated formamide R*. Shake the solution obtained for 30 min.

Reference solution Dilute 0.1 ml of *nitrosodipropylamine solution R* in 6.0 ml of *ethanol R*. Dilute 0.1 ml of the solution obtained in 1.0 ml of *treated formamide R*. (This solution is equivalent to 0.05 ppm of N-NO groups).

Place 50 ml of *treated ethyl acetate R* in the dry 500 ml borosilicate glass round-bottomed flask equipped with a septum. Connect the round-bottomed flask to the condenser which has been previously cooled to - 15 °C for 2 h.

Connect the *argon R* cannula and adjust the flow rate to 0.1 litre/min. Check that the system is leak-free. Only the connector to the chemiluminescence detector remains open in order to avoid excess pressure.

Heat the treated *ethyl acetate R* to boiling.

Evacuate the system by slowly turning the valve of the chemiluminescence detector. At the same time tighten the inlet on the chemiluminescence detector.

When the system is equilibrated, the vacuum reaches 4 mm Hg.

The signal of the zero adjuster on the chemiluminescence detector is set to 10 per cent of the full scale of the recorder.

Through the septum of the 500 ml borosilicate glass round-bottomed flask, sequentially inject 0.5 ml of *water R*, 2.0 ml of *dilute hydrobromic acid R* and then another 2.0 ml of *dilute hydrobromic acid R*, making sure that the recorder pen has returned to the baseline between each injection.

Inject 50.0 µl of the reference solution, then 50.0 µl of the test solution after the recorder pen has returned to the baseline.

Calculate the content of N-NO groups of the substance to be examined.

Free sulphates

Not more than 0.5 per cent, determined by liquid chromatography (*2.2.29*) using an instrument equipped with a conductivity detector.

Test solution Dissolve 30.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution Dissolve 1.4787 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 1.0 ml of this solution to 200.0 ml with *distilled water R* (5 ppm of sulphate ions).

The chromatographic procedure may be carried out using:

— an anion separation column 50 mm long and 4.6 mm in internal diameter;

— a chemical neutralisation system: neutralisation micromembrane in line with the mobile phase for anion detection;

— elute with a 1.91 g solution of *disodium tetraborate R* in 1000 ml of *water R* as the mobile phase for 15 min; change to 100 per cent of *0.1 M sodium hydroxide* for a period of 0.5 min;

elute with this solution for 10 min; return to the initial conditions for a period of 0.5 min; the flow rate is 1.0 ml/min,

— a detector with a sensitivity of 30 µS.

Continuously pump the chemical neutralisation system in counter-flow with a 2.45 g/l solution of *sulphuric acid R*, at a flow rate of 4 ml/min.

Inject 50 µl of each solution. The chromatogram obtained with the reference solution shows a principal peak which corresponds to the sulphate ion (retention time of about 7.5 min). Change the composition of the mobile phase, if necessary, to obtain the prescribed retention time. Calculate the sulphate content of the substance to be examined.

DEFINITION

Nicotine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-[(2*S*)-1-methylpyrrolidin-2-yl]pyridine, calculated with reference to the anhydrous substance.

CHARACTERS

A colourless or brownish viscous liquid, volatile, hygroscopic, soluble in water, miscible with ethanol.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry *(2.2.24)*, comparing with the *Ph. Eur. reference spectrum of nicotine.*

TESTS

Appearance of solution

Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear *(2.2.1)* and not more intensely coloured than reference solution Y_5, BY_5 or R_5 *(2.2.2, Method II)*.

Specific optical rotation *(2.2.7)*

Dissolve 1.00 g in *ethanol R* and dilute to 50.0 ml with the same solvent. The specific optical rotation is -140 to -152.

Related substances

Examine by liquid chromatography *(2.2.29)*.

Test solution Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a) Dissolve 4 mg of *nicotine ditartrate CRS* and 2 mg of *myosmine R* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b) Dilute 0.4 ml of the test solution to 100.0 ml with the mobile phase.

The chromatography may be carried out using:

— a stainless steel column 0.10 m long and 8 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (4 µm);

— as mobile phase at a flow rate of 1.5 ml/min a solution prepared as follows: dissolve 2.31 g of *sodium dodecyl sulphate R* in a mixture of 250 ml of *acetonitrile R* and 750 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 4.5 with *sodium hydroxide R* or *phosphoric acid R*;

— as detector a spectrophotometer set at 254 nm.

Inject 25 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: nicotine about 13 min and impurity D about 11 min. The test is not valid unless the resolution between the impurity D peak eluting closest to the nicotine peak and the peak due to nicotine is at least 1.5; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 25 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 25 µl of the test solution and 25 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water *(2.5.12)*

Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

ASSAY

Dissolve 60.0 mg in 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically *(2.2.20)*.

1 ml of *0.1 M perchloric acid* is equivalent to 8.11 mg of $C_{10}H_{14}N_2$.

STORAGE

Store, under nitrogen, in an airtight container , protected from light.

DEFINITION

Mixture of mono-, di- and triesters of omega-3 acids with glycerol containing mainly triesters and obtained either by esterification of concentrated and purified omega-3 acids with glycerol or by transesterification of the omega-3-acid ethyl esters with glycerol. The origin of the omega-3 acids is the body oil from fatty fish species coming from families like *Engraulidae*, *Carangidae, Clupeidae, Osmeridae, Salmonidae and Scombridae*. The omega-3 acids are identified as the following acids: alpha-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA), heneicosapentaenoic acid (C21:5 n-3), clupanodonic acid (C22:5 n-3) and cervonic (docosahexaenoic) acid (C22:6 n-3; DHA).

Content:

- — sum of the contents of the omega-3 acids EPA and DHA, expressed as triglycerides: minimum 45.0 per cent;
- — total omega-3 acids, expressed as triglycerides: minimum 60.0 per cent.

Tocopherol may be added as an antioxidant.

CHARACTERS

Appearance

Pale yellow liquid.

Solubility

Practically insoluble in water, very soluble in acetone and in heptane, slightly soluble in anhydrous ethanol.

IDENTIFICATION

Results The peaks due to eicosapentaenoic acid methyl ester and to docosahexaenoic acid methyl ester in the chromatogram obtained with test solution (b) are similar in retention time and size to the corresponding peaks in the chromatogram obtained with reference solution (a)

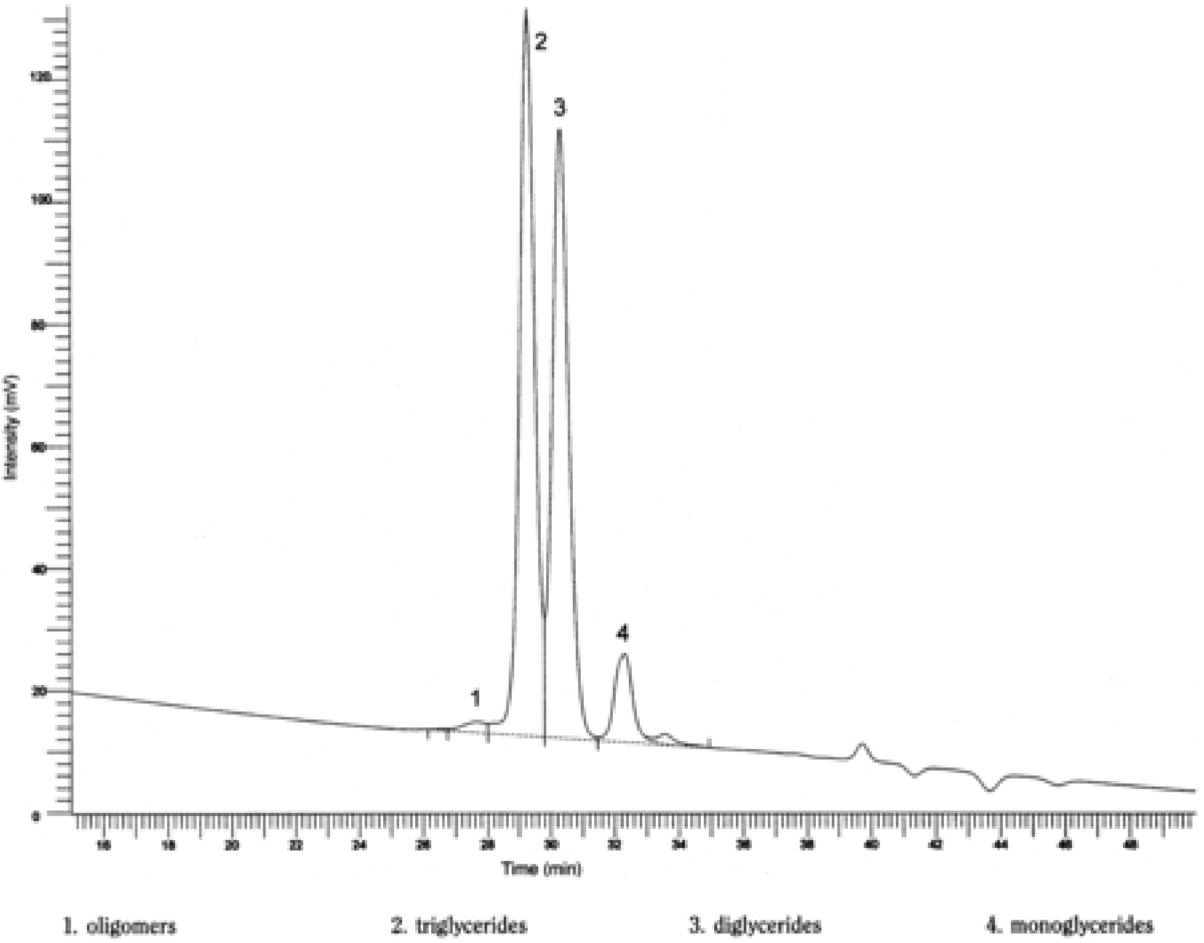

Figure 1352.-1. – *Chromatogram of the test for oligomers and partial glycerides in omega-3-acid triglycerides*

TESTS

Absorbance (*2.2.25*)

Maximum 0.73 at 233 nm.

Dilute 0.300 g of the substance to be examined to 50.0 ml with *trimethylpentane R*. Dilute 2.0 ml of this solution to 50.0 ml with *trimethylpentane R*.

Acid value (*2.5.1*)

Maximum 3.0, determined on 10.0 g in 50 ml of the prescribed mixture of solvents.

Anisidine value

Maximum 30.0.

The anisidine value is defined as 100 times the absorbance measured in a 1 cm cell filled with a solution containing 1 g of the substance to be examined in 100 ml of a mixture of solvents and reagents according to the method described below.

Carry out the operations as rapidly as possible, avoiding exposure to actinic light.

Test solution (a) Dilute 0.500 g of the substance to be examined to 25.0 ml with *trimethylpentane R*.

Test solution (b) To 5.0 ml of test solution (a) add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R,* shake and store protected from light.

Reference solution To 5.0 ml of *trimethylpentane R* add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in glacial *acetic acid R*, shake and store protected from light.

Measure the absorbance (*2.2.25*) of test solution (a) at 350 nm using *trimethylpentane R* as the compensation liquid. Measure the absorbance of test solution (b) at 350 nm exactly 10 min after its preparation, using the reference solution as the compensation liquid.

Calculate the anisidine value using the following expression:

$$\frac{25 \times (1.2A_s - A_b)}{m}$$

A_s = absorbance of test solution (b)

A_b = absorbance of test solution (a)

m = mass of the substance to be examined in test solution (a), in grams.

Peroxide value (*2.5.5, Method A*)

Maximum 10.0.

Oligomers and partial glycerides

Size-exclusion chromatography (*2.2.30*).

— *resolution*: minimum of 2.0 between the peaks due to monodocosahexaenoin and to didocosahexaenoin and minimum of 1.0 between the peaks due to didocosahexaenoin and to tridocosahexaenoin.

Identify the peaks from the chromatogram (Figure 1352.-1). Calculate the percentage content of oligomers using the following expression:

$$\frac{B}{A} \times 100$$

A = sum of the areas of all the peaks in the chromatogram,

B = area of the peak with a retention time smaller than the retention time of the triglyceride peak.

Calculate the percentage content of partial glycerides using the following expression:

$$\frac{C}{A} \times 100$$

C = (sum of the) area(s) of the peak(s) due to the mono- and diglycerides.

Limits:

— *oligomers*: maximum 3.0 per cent;

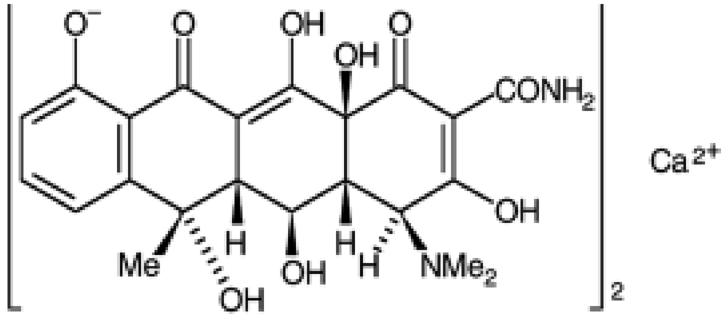
Oxytetracycline Calcium

General Notices



$(C_{22}H_{23}N_2O_9)_2Ca$ 958.9 *15251-48-6*

Action and use

Tetracycline antibacterial.

DEFINITION

Oxytetracycline Calcium is the calcium salt of (4*S*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-4-dimethylamino-1, 4,4a,5, 5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11dioxonaphthacene-2-carboxamide, a substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means. It contains not less than 90.0% and not more than 100.5% of $(C_{22}H_{23}N_2O_9)_2Ca$, calculated with reference to the anhydrous substance.

CHARACTERISTICS

A pale yellow to greenish fawn, crystalline powder.

Practically insoluble in *water*; soluble in dilute acids. It dissolves slowly in 5M *ammonia*.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Adjust the pH of a 10% w/v solution of *disodium edetate* to 7.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 ml for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Before use, dry the plate at 110° for 1 hour. Apply separately to the plate 1 µl of each of three solutions in 0.01M *methanolic hydrochloric acid* containing (1) 0.05% w/v of the substance being examined, (2) 0.05% w/v of *oxytetracycline EPCRS* and (3) 0.05% w/v of each of *oxytetracycline EPCRS* and *demeclocycline hydrochloride EPCRS.* After removal of the plate, dry it in a current of air and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. To 2 mg add 5 ml of *sulphuric acid*; a deep red colour is produced. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. Yields reaction B characteristic of *calcium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH of a 2.5% w/v suspension, 6.0 to 7.5, Appendix V L.

Light absorption

Absorbance of a 0.002% w/v solution in *0.1M chloride buffer pH 2.0* at the maximum at 353 nm, 0.56 to 0.61, calculated with reference to the anhydrous substance, Appendix II B.

Specific optical rotation

In a 1% w/v solution in 0.1M *hydrochloric acid*, -194 to -210, calculated with reference to the anhydrous substance, Appendix V F. Allow the solution to stand protected from light for 30 minutes before measurement.

Light-absorbing impurities

A. Dissolve 0.2 g in 6 ml of 1M *hydrochloric acid* and add sufficient *methanol* to produce 100 ml. The *absorbance* at 430 nm, when measured within 1 hour of preparing the solution, is not more than 0.30, calculated with reference to the anhydrous substance, Appendix II B.

B. Dissolve 1 g in 6 ml of 1M *hydrochloric acid* and add sufficient *methanol* to produce 100 ml. The *absorbance* at 490 nm, when measured within 1 hour of preparing the solution, is not more than 0.20, calculated with reference to the anhydrous substance, Appendix II B.

Calcium

3.90 to 4.20%, calculated with reference to the anhydrous substance, when determined by the following method. Transfer about 1 g, accurately weighed, to a Kjeldahl flask, cautiously add 10 ml of *nitric acid* and mix. Allow to stand for 5 minutes, add a glass bead and heat on a water bath for 5 minutes. Remove from the water bath, cautiously add 5 ml of 9M *perchloric acid* and heat, adding further 5 ml quantities of the perchloric acid at intervals until the liquid is almost colourless. Add 0.1 ml of *nitric acid* and allow any further reaction to subside. Do not allow the volume of the liquid in the flask to be reduced below 3 ml at any stage in the oxidation. Wash the walls of the flask with 40 ml of *water*, collecting the washings in the flask, and boil for 3 to 4 minutes to expel chlorine. Cool, transfer the contents of the flask to a conical flask with the aid of *water* and dilute to about 200 ml with *water*. Adjust to pH 9 with 5M *sodium hydroxide* and then add 100 ml of *water* followed by 12 ml of 10M *sodium hydroxide* and mix. Add about 15 mg of *calconcarboxylic acid triturate* and titrate with 0.05M *disodium edetate VS* until the colour changes from violet to full blue. Each ml of 0.05M *disodium edetate VS* is equivalent to 2.004 mg of Ca.

Water

Not more than 15.0% w/w, Appendix IX C. Use 0.25 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For solution (1) dilute 1 volume of a 0.1% w/v solution of the substance being examined in 0.1M *hydrochloric acid* to 20 volumes with the mobile phase. For solution (2) dilute 1 volume of a 0.1% w/v solution of *oxytetracycline EPCRS* in 0.1M *hydrochloric acid* to 20 volumes with the mobile phase. Solution (3) contains 0.1% w/v of *4-epioxytetracycline EPCRS* in 0.1M *hydrochloric acid*. Solution (4) contains 0.1% w/v of *tetracycline hydrochloride BPCRS* in 0.1M *hydrochloric acid*. For solution (5) dilute a mixture containing 1.5 ml of a 0.1% w/v solution of *oxytetracycline EPCRS* in 0.1M *hydrochloric acid*, 1 ml of solution (3) and 3 ml of solution (4) to 25 ml with the mobile phase.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 to 10 µm) (Polymer Laboratories, PLRP-S 100A, is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 1 ml per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. To 50.0 g of *2-methyl-propan-2-ol* add 200 ml of *water*, 60 ml of *0.33*M *phosphate buffer pH 7.5*, 50 ml of a 1.0% w/v solution of *tetrabutylammonium hydrogen sulphate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and 10 ml of a 0.04% w/v solution of *disodium edetate* previously adjusted to pH 7.5 with 2M *sodium hydroxide* and dilute to 1 litre with *water*.

Inject solution (5). The assay is not valid unless (a) the *resolution factor* between the first peak (4-epioxytetracycline) and the second peak (oxytetracycline) is at least 4.0, (b) the *resolution factor* between the second peak and the third peak (tetracycline) is at least 5.0 (if necessary reduce the content of 2-methylpropan-2-ol in the mobile phase to increase the resolution) and (c) the *symmetry factor* of the peak due to oxytetracycline is not more than 1.25.

Calculate the content of $(C_{22}H_{23}N_2O_9)_2Ca$ from the declared content of $C_{22}H_{24}N_2O_9$ in *oxytetracycline EPCRS*. Each mg of $C_{22}H_{24}N_2O_9$ is equivalent to 1.041 mg of $(C_{22}H_{23}N_2O_9)_2Ca$.

STORAGE

Oxytetracycline Calcium should be protected from light and stored at a temperature of 2° to 8°.

LABELLING

The label states (1) the date after which the material is not intended to be used; (2) the conditions under which it should be stored.

CHARACTERS

Appearance

Clear, colourless or greenish-yellow transparent liquid.

Solubility

Practically insoluble in ethanol (96 per cent), miscible with light petroleum (50-70 °C).

When cooled, it begins to become cloudy at 10 °C and becomes a butter-like mass at about 0 °C.

Relative density

About 0.913.

IDENTIFICATION

A. Acid value (see Tests).

B. Identification of fatty oils by thin-layer chromatography *(2.3.2)*.

Results The chromatogram obtained shows spots corresponding to those in the typical chromatogram for olive oil (see Figure 2.3.2.-1). For certain types of olive oil, the difference in the size of spots E and F is less pronounced than in the typical chromatogram.

TESTS

Acid value *(2.5.1)*

Maximum 0.3, determined on 10.0 g.

Peroxide value *(2.5.5, Method A)*

Maximum 10.0. If intended for use in the manufacture of parenteral preparations: maximum 5.0.

Unsaponifiable matter

Maximum 1.5 per cent.

Place 5.0 g (*m g*) in a 150 ml flask fitted with a reflux condenser. Add 50 ml of *2 M alcoholic potassium hydroxide R* and heat on a water-bath for 1 h, shaking frequently. Add 50 ml of *water R* through the top of the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel. Rinse the flask with several portions totalling 50 ml of *light petroleum R1* and add the rinsings to the separating funnel. Shake vigorously for 1 min. Allow to separate and transfer the aqueous layer to a 2nd separating funnel. If an emulsion forms, add small quantities of *ethanol (96 per cent) R* or a concentrated solution of *potassium hydroxide R*. Shake the aqueous layer with 2 quantities, each of 50 ml, of *light petroleum R1*. Combine the light petroleum layers in a 3rd separating funnel and wash with 3 quantities, each of 50 ml, of *ethanol (50 per cent V/V) R*. Transfer the light petroleum layer to a tared 250 ml flask. Rinse the separating funnel with small quantities of *light petroleum R1* and add to the flask. Evaporate the light petroleum on a water-bath and dry the residue at 100-105 °C for 15 min, keeping the flask horizontal. Allow to cool in a desiccator and weigh (*a g*). Repeat the drying for successive periods of 15 min until the loss of mass between 2 successive weighings does not exceed 0.1 per cent. Dissolve the residue in 20 ml of *ethanol (96 per cent) R*, previously neutralised to 0.1 ml of *bromophenol blue solution R*. If necessary, titrate with *0.1 M hydrochloric acid* (b ml).

Calculate the percentage content of unsaponifiable matter using the following expression:

$$\frac{100\,(a - 0.032b)}{m}$$

If 0.032*b* is greater than 5 per cent of a, the test is not valid and must be repeated.

Polycyclic aromatic hydrocarbons

Use reagents for ultraviolet absorption spectrophotometry. Dissolve 0.50 g in 25 ml of *heptane R* and place in a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add 5.0 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until 2 clear layers are formed. Transfer the lower layer to a 2nd separating funnel, add 2 ml of *heptane R* and shake the mixture vigorously. Allow to stand until 2 clear layers are formed. Add 0.1 ml of *starch mucilage* and 10 ml of *chloroform* and complete the titration with vigorous shaking. Repeat the operation without the material being examined. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O.

STORAGE

Liquefied Phenol should be protected from light. Liquefied Phenol may congeal or deposit crystals if stored at a temperature below 4°. It should be completely melted before use.

Microbial contamination

Total viable aerobic count *(2.6.12)* not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella (2.6.13)*.

ASSAY

Total proteolytic activity

The total proteolytic activity of pancreas powder is determined by comparing the quantity of peptides non-precipitable by a 50 g/l solution of *trichloroacetic acid R* released per minute from a substrate of casein solution with the quantity of such peptides released by *pancreas powder (protease) BRP* from the same substrate in the same conditions.

Casein solution Suspend a quantity of *casein BRP* equivalent to 1.25 g of dried substance in 5 ml of *water R*, add 10 ml of *0.1 M sodium hydroxide* and stir for 1 min. (Determine the water content of *casein BRP* prior to the test by heating at 60 °C *in vacuo* for 4 h.) Add 60 ml of *water R* and stir with a magnetic stirrer until the solution is practically clear. Adjust to pH 8.0 with *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid*. Dilute to 100.0 ml with *water R*. Use the solution on the day of preparation.

Enterokinase solution Dissolve 50 mg of *enterokinase BRP* in *0.02 M calcium chloride solution R* and dilute to 50.0 ml with the same solvent. Use the solution on the day of preparation.

For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0-4 °C.

Test suspension Triturate 0.100 g of the substance to be examined for 5 min adding gradually 25 ml of *0.02 M calcium chloride solution R*. Transfer completely to a volumetric flask and dilute to 100.0 ml with *0.02 M calcium chloride solution R*. To 10.0 ml of this suspension add 10.0 ml of the enterokinase solution and heat on a water-bath at 35 ± 0.5 °C for 15 min. Cool and dilute with *borate buffer solution pH 7.5 R* at 5 ± 3 °C to a final concentration of about 0.065 Ph. Eur. U. of total proteolytic activity per millilitre calculated on the basis of the stated activity.

Reference suspension Prepare a suspension of *pancreas powder (protease) BRP* as described for the test suspension but without the addition of enterokinase so as to obtain a known final concentration of about 0.065 Ph. Eur. U. per millilitre calculated on the basis of the stated activity.

Designate tubes in duplicate T, T_b, S_1, S_{1b}, S_2, S_{2b}, S_3, S_{3b}; designate a tube B.

Add *borate buffer solution pH 7.5 R* to the tubes as follows:

B: 3.0 ml,

S_1 and S_{1b}: 2.0 ml,

S_2, S_{2b}, T and T_b: 1.0 ml.

Add the reference suspension to the tubes as follows:

S_1 and S_{1b}: 1.0 ml,

S_2 and S_{2b}: 2.0 ml,

S_3 and S_{3b}: 3.0 ml.

Add 2.0 ml of the test suspension to tubes T and T_b.

Add 5.0 ml of a 50 g/l solution of *trichloroacetic acid R* to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix by shaking.

Place the tubes and the casein solution in a water-bath at 35 ± 0.5 °C. Place a glass rod in each tube. When temperature equilibrium is reached, add 2.0 ml of the casein solution to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix. At time zero, add 2.0 ml of casein solution successively and at intervals of 30 s to tubes S_1, S_2, S_3 and T. Mix immediately after each addition. Exactly 30 min after addition of the casein solution, taking into account the regular interval adopted, add 5.0 ml of a 50 g/l solution of *trichloroacetic acid R* to tubes S_1, S_2, S_3 and T. Mix. Withdraw the tubes from the water-bath and allow to stand at room temperature for 20 min.

Filter the contents of each tube twice through the same suitable filter paper previously washed with a 50 g/l solution of *trichloroacetic acid R*, then with *water R* and dried.

A suitable filter paper complies with the following test: filter 5 ml of a 50 g/l solution of *trichloroacetic acid R* on a 7 cm disc of white filter paper; the absorbance *(2.2.25)* of the filtrate, measured at 275 nm using unfiltered trichloroacetic acid solution as the compensation liquid, is less than 0.04.

Measure the absorbance *(2.2.25)* of the filtrates at 275 nm using the filtrate obtained from tube B as the compensation liquid.

Correct the average absorbance values for the filtrates obtained from tubes S_1, S_2 and S_3 by subtracting the average values obtained for the filtrates from tubes S_{1b}, S_{2b} and S_{3b} respectively. Draw a calibration curve of the corrected values against volume of reference suspension used.

Determine the activity of the substance to be examined using the corrected absorbance for the test suspension ($T - T_b$) and the calibration curve and taking into account the dilution factors.

The test is not valid unless the corrected absorbance values are between 0.15 and 0.60.

Lipolytic activity

The lipolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of olive oil emulsion with the rate at which a suspension of *pancreas powder (amylase and lipase) BRP* hydrolyses the same substrate under the same conditions. The test is carried out under nitrogen.

Olive oil stock emulsion In an 800 ml beaker 9 cm in diameter, place 40 ml of *olive oil R*, 330 ml of *acacia solution R* and 30 ml of *water R*. Place an electric mixer at the bottom of the beaker. Place the beaker in a vessel containing *ethanol (96 per cent) R* and a sufficient quantity of ice as a cooling mixture. Emulsify using the mixer at an average speed of 1000-2000 r/min. Cool to 5-10 °C. Increase the mixing speed to 8000 r/min. Mix for 30 min keeping the temperature below 25 °C by the continuous addition of crushed ice into the cooling mixture. (A mixture of calcium chloride and crushed ice is also suitable). Store the stock emulsion in a refrigerator and use within 14 days. The emulsion must not separate into 2 distinct layers. Check the diameter of the globules of the emulsion under a microscope. At least 90 per cent have a diameter below 3 µm and none has a diameter greater than 10 µm. Shake the emulsion thoroughly before preparing the emulsion substrate.

Olive oil emulsion For 10 determinations, mix the following solutions in the order indicated: 100 ml of the stock emulsion, 80 ml of *tris(hydroxymethyl)aminomethane solution R1*, 20 ml of a freshly prepared 80 g/l of *sodium taurocholate BRP* and 95 ml of *water R*. Use on the day of preparation.

Apparatus Use a reaction vessel of about 50 ml capacity provided with:

— a device that will maintain a temperature of 37 ± 0.5 °C;

— a magnetic stirrer;

— a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. In the latter case, the burette is graduated in 0.005 ml and the pH-meter is provided with a wide reading scale and glass-calomel or glass-silver-silver chloride electrodes. After each test the reaction vessel is evacuated by suction and washed several times with *water R*, the washings being removed each time by suction.

Test suspension In a small mortar cooled to 0-4 °C, triturate carefully a quantity of the substance to be examined equivalent to about 2500 Ph. Eur. U. of lipolytic activity with 1 ml of cooled *maleate buffer solution pH 7.0 R* (lipase solvent) until a very fine suspension is obtained. Dilute the suspension with cold *maleate buffer solution pH 7.0 R*, transfer quantitatively to a volumetric flask and dilute to 100.0 ml with the cold buffer solution. Keep the flask containing the test suspension in iced water during the titration.

Reference suspension To avoid absorption of water formed by condensation, allow the reference preparation to reach room temperature before opening the container. Prepare a *suspension of pancreas powder (amylase and lipase) BRP* as described for the test suspension using a quantity equivalent to about 2500 Ph. Eur. U.

Carry out the titrations immediately after preparation of the test suspension and the reference suspension. Place 29.5 ml of olive oil emulsion in the reaction vessel equilibrated at 37 ± 0.5 °C. Fit the vessel with the electrodes, a stirrer and the burette (the tip being immersed in the olive oil emulsion).

Put the lid in place and switch on the apparatus. Carefully add *0.1 M sodium hydroxide* with stirring to adjust to pH 9.2. Using a rapid-flow graduated pipette transfer about 0.5 ml of the previously homogenised reference suspension, start the chronometer and add continuously *0.1 M sodium hydroxide* to maintain the pH at 9.0. After exactly 1 min, note the volume of *0.1 M sodium hydroxide* used. Carry out the measurement a further 4 times. Discard the first reading and determine the average of the 4 others (S_1). Make 2 further determinations (S_2 and S_3). Calculate the average of the values S_1, S_2 and S_3. The average volume of *0.1 M sodium hydroxide* used should be about 0.12 ml per minute with limits of 0.08 ml to 0.16 ml.

Carry out 3 determinations in the same manner for the test suspension (T_1, T_2 and T_3). If the quantity of *0.1 M sodium hydroxide* used is outside the limits of 0.08 ml to 0.16 ml per minute, the assay is repeated with a quantity of test suspension that is more suitable but situated between 0.4 ml and 0.6 ml. Otherwise the quantity of the substance to be examined is adjusted to comply with the conditions of the test. Calculate the average of the values T_1, T_2 and T_3.

Calculate the activity in European Pharmacopoeia Units per milligram using the following expression:

$$\frac{n \times m_1}{n_1 \times m} \times A$$

n = average volume of *0.1 M sodium hydroxide* used per minute during the titration of the test suspension, in millilitres;

n_1 = average volume of *0.1 M sodium hydroxide* used per minute during the titration of the reference suspension, in millilitres;

m = mass of the substance to be examined, in milligrams;

m_1 = mass of the reference preparation, in milligrams;

A = activity of *pancreas powder (amylase and lipase) BRP*, in European Pharmacopoeia Units per milligram.

Amylolytic activity

The amylolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of starch solution with the rate at which a suspension of *pancreas powder (amylase and lipase) BRP* hydrolyses the same substrate under the same conditions.

Starch solution To a quantity of *starch BRP* equivalent to 2.0 g of the dried substance add 10 ml of *water R* and mix. (Determine the water content of *starch BRP* prior to the test by heating at 120 °C for 4 h). Add this suspension, whilst stirring continuously, to 160 ml of boiling *water*

R. Wash the container several times with successive quantities, each of 10 ml, of *water R* and add the washings to the hot starch solution. Heat to boiling, stirring continuously. Cool to room temperature and dilute to 200 ml with *water R*. Use the solution on the day of preparation.

For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0-4 °C.

Test suspension Triturate a quantity of the substance to be examined equivalent to about 1500 Ph. Eur. U. of amylolytic activity with 60 ml of *phosphate buffer solution pH 6.8 R1* for 15 min. Transfer quantitatively to a volumetric flask and dilute to 100.0 ml with *phosphate buffer solution pH 6.8 R1*.

Reference suspension Prepare a suspension of *pancreas powder (amylase and lipase) BRP* as described for the test suspension, using a quantity equivalent to about 1500 Ph. Eur. U.

In a test tube 200 mm long and 22 mm in diameter, fitted with a ground-glass stopper, place 25.0 ml of starch solution, 10.0 ml of *phosphate buffer solution pH 6.8 R1* and 1.0 ml of an 11.7 g/l solution of *sodium chloride R*. Close the tube, shake and place in a water-bath at 25.0 ± 0.1 °C. When the temperature equilibrium has been reached, add 1.0 ml of the test suspension and start the chronometer. Mix and place the tube in the water-bath. After exactly 10 min, add 2 ml of *1 M hydrochloric acid*. Transfer the mixture quantitatively to a 300 ml conical flask fitted with a ground-glass stopper. Whilst shaking continuously, add 10.0 ml of *0.05 M iodine* immediately followed by 45 ml of *0.1 M sodium hydroxide*. Allow to stand in the dark at a temperature between 15 °C and 25 °C for 15 min. Add 4 ml of a mixture of 1 volume of *sulphuric acid R* and 4 volumes of *water R*. Titrate the excess of iodine with *0.1 M sodium thiosulphate* using a microburette. Carry out a blank titration adding the 2 ml of *1 M hydrochloric acid* before introducing the test suspension. Carry out the titration of the reference suspension in the same manner.

Calculate the amylolytic activity in European Pharmacopoeia Units per milligram using the following expression:

$$\frac{(n' - n)\,m_1}{(n'_1 - n_1)\,m} \times A$$

n = volume of *0.1 M sodium thiosulphate* used in the titration of the test suspension, in millilitres;

n_1 = volume of *0.1 M sodium thiosulphate* used in the titration of the reference suspension, in millilitres;

n' = volume of *0.1 M sodium thiosulphate* used in the blank titration of the test suspension, in millilitres;

n'_1 = volume of *0.1 M sodium thiosulphate* used in the blank titration of the reference suspension, in millilitres;

m = mass of the substance to be examined, in milligrams;

m_1 = mass of the reference preparation, in milligrams;

A = activity of *pancreas powder (amylase and lipase) BRP*, in European Pharmacopoeia Units per milligram.

ASSAY OF PANCREATIN

The free protease, lipase and amylase activities of pancreatin are determined by the following methods.

STANDARD PREPARATION AND UNITS

The Standard Preparation is the appropriate FIP Standard which has been adopted as an official preparation by the European Pharmacopoeia Commission and is available as *pancreas powder (protease) EPBRP* or *pancreas powder (amylase and lipase) EPBRP* as appropriate.

The Unit of protease activity is contained in that amount of the Standard Preparation that, under the conditions of the assay, hydrolyses casein at an initial rate such that there is liberated per minute an amount of peptides not precipitated by trichloroacetic acid that gives the same absorbance at 275 nm as one micromole of tyrosine. The Unit of lipase activity is contained in that amount of the Standard Preparation that, under the conditions of the assay, liberates one micro-equivalent of acid per minute at pH 9.0 and 37°. The Unit of amylase activity is contained in that amount of the standard preparation that, under the conditions of the assay, decomposes starch at an initial rate such that one micro-equivalent of glycosidic linkage is hydrolysed per minute.

FOR FREE PROTEASE ACTIVITY

Method

Solution of the standard preparation Triturate for 5 minutes a quantity of the Standard Preparation containing approximately 100 Units of protease activity with 25 ml of *calcium* *chloride solution* cooled to 5°. Dilute to 100 ml with the cooled *calcium chloride solution* and then dilute a sufficient quantity of the resulting suspension to 100 ml with *borate buffer pH 7.5*, cooled to 5°, so that 1 ml of the final solution contains 0.065 Units of protease activity.

Solution of the substance being examined Triturate for 5 minutes a quantity of the substance being examined containing approximately 100 Units of protease activity with 25 ml of *calcium chloride solution* cooled to 5°. Dilute to 100 ml with the cooled *calcium chloride solution* and then dilute a sufficient quantity of the resulting suspension to 100 ml with *borate buffer pH 7.5*, cooled to 5°, so that the estimated free protease activity corresponds approximately to the activity of the solution of the Standard Preparation.

Label 16 test tubes with the following identification in duplicate; S_1, S_2, S_3, S_1B, S_2B, S_3B, U and UB. To tubes S_1 and S_1B add 2.0 ml and to tubes S_2, S_2B, U and UB, 1.0 ml of *borate buffer pH 7.5*. Then to tubes S_1 and S_1B add 1.0 ml, to tubes S_2 and S_2B, 2.0 ml and to tubes S_3 and S_3B, 3.0 ml of the solution of the Standard Preparation. Add 2.0 ml of the solution of the substance being examined to tubes U and UB. To each of the control tubes (S_1B, S_2B, S_3B and UB) add 5.0 ml of a 5% w/v solution of *trichloroacetic acid* and mix. Place a stirring rod in each tube and warm to, and maintain at, 35° in a water bath. Add 5.0 ml of *concentrated casein substrate* to each of the control tubes and mix.

At accurately timed intervals add 5.0 ml of *concentrated casein substrate*, previously warmed to 35°, to tubes S_1, S_2, S_3 and U and mix immediately. After exactly 30 minutes, in the same order, stop the reaction in tubes S_1, S_2, S_3 and U by adding 5.0 ml of a 5% w/v solution of *trichloroacetic acid* and mix thoroughly. Remove all the test tubes from the water bath and allow to stand at room temperature for 20 minutes. Filter the contents of the tubes through suitable filter paper[1] , collect the filtrates and refilter through the same paper. The filtrates must be free from haze.

Measure the *absorbances* of the filtrates at the maximum at 275 nm, Appendix II B, using in the reference cell a mixture of 6.0 ml of *borate buffer pH 7.5* and 5.0 ml of the 5% w/v solution of *trichloroacetic acid* that has been filtered in the same way. Correct the mean absorbances of the filtrates from tubes S_1, S_2 and S_3 by subtracting the mean absorbances of the filtrates from the corresponding control tubes S_1B, S_2B and S_3B.

Prepare a reference curve by plotting the mean corrected absorbances against the potency of the dilution of the solution of the Standard Preparation used. Calculate the corrected mean absorbance of the substance being examined by subtracting the mean absorbance of the filtrates from tubes UB from that of the filtrates from tubes U. Using the corrected mean absorbance, determine the potency of the solution of the substance being examined from the reference curve and calculate the free protease activity per mg of the substance being examined by taking into account the dilution factors.

The test is not valid unless the corrected absorbances are between 0.15 and 0.60.

FOR LIPASE ACTIVITY

Apparatus

Use a reaction vessel of about 50 ml capacity fitted with a device that will maintain a temperature of 36.5° to 37.5°, a magnetic stirrer and a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents. An automatic or manual titration apparatus may be used. In the latter case, the burette is graduated in 5-µl divisions and the pH meter is provided with a wide reading scale and glass and calomel electrodes. After each test the reaction vessel is evacuated by suction and washed several times with water, the washings being removed each time by suction.

Method

Carry out the assay under nitrogen. In a small mortar cooled to 0° to 4° triturate carefully an amount of the substance being examined containing approximately 2500 Units of lipase activity with 1 ml of cooled *lipase solvent* until a very fine suspension is obtained (about 10 minutes). Dilute with cooled *lipase solvent*, transfer quantitatively to a graduated flask and dilute to 100.0 ml with the cooled solvent; use immediately.

Transfer 29.5 ml of *olive oil substrate emulsion* to the assembled reaction vessel equilibrated at 36.5° to 37.5° and adjust the pH to 9.2 with 0.1M *sodium hydroxide*. Add about 0.5 ml of the suspension of the substance being examined and record the time at which the pH reaches 9.0. Add continuously from a micrometer syringe sufficient 0.1M *sodium hydroxide VS* to maintain the pH at 9.0. Record the volume of 0.1M *sodium hydroxide VS* consumed at 1-minute intervals for 5 minutes. Discounting the first reading, calculate the mean rate of alkali consumption U. If necessary, dilute with sufficient *lipase solvent* to produce an average alkali consumption of 0.08 to 0.16 ml of 0.1M *sodium hydroxide VS* per minute. Repeat the procedure using the Standard Preparation in place of the substance being examined and calculate the mean rate of alkali consumption, S. Calculate the potency (P_L) of the substance being examined in Units per mg from the expression:

$$P_L = \frac{U}{S} \times \frac{w_s}{w} \times R$$

Where U = the mean volume in ml of 0.1M *sodium hydroxide VS* used per minute in the titration of the substance being examined,

S = the mean volume in ml of 0.1M *sodium hydroxide VS* used per minute in the titration of the Standard Preparation,

w = weight in mg of the substance being examined,

w_s = weight in mg of the Standard Preparation,

R = potency of the Standard Preparation in Units per mg.

Calculate the potency of the substance being examined using the average of three separate titrations for both the substance being examined and the Standard Preparation.

FOR AMYLASE ACTIVITY

Method

Triturate an amount of the substance being examined containing approximately 1500 Units of amylase activity with 60 ml of *0.2M mixed phosphate buffer pH 6.8* for 15 minutes and add sufficient *0.2*M *mixed phosphate buffer mixed phosphate buffer p*H 6.8 to produce 100 ml. To a stoppered tube (200 mm × 22 mm) add 25.0 ml of *starch substrate*, 10.0 ml of *0.2*M *mixed phosphate buffer pH 6.8* and 1.0 ml of 0.2M *sodium chloride*. Stopper the tube, mix the contents and place in a water bath at 24.9° to 25.1°. When the temperature of the mixture has reached 25° add 1.0 ml of the solution of the substance being examined and record the time of addition. Mix thoroughly and replace in the water bath. After exactly 10 minutes add 2 ml of 1M *hydrochloric acid* to stop the reaction. Transfer the contents of the tube to a stoppered 300 ml flask. While shaking continuously add 10.0 ml of 0.05M *iodine VS* followed immediately by 45 ml of 0.1M *sodium hydroxide*. Allow to stand in the dark at a temperature of 15° to 25° for 15 minutes. Add 4 ml of a mixture of 1 volume of *sulphuric acid* and 4 volumes of *water* and titrate with 0.1M *sodium thiosulphate VS*. Repeat the procedure but add the 2 ml of 1M *hydrochloric acid* before the addition of the solution of the substance being examined. Prepare a solution of the Standard Preparation in the same manner as described for the solution of the substance being examined and repeat the procedure beginning at the words 'To a stoppered tube …' but using 1.0 ml of this solution in place of the solution of the substance being examined.

Calculate the potency (P_A) of the substance being examined in Units per mg from the expression:

$$P_A = \frac{(B - A)w_s}{(B_s - A_s)w} \times Q$$

Where A = volume in ml of 0.1M *sodium thiosulphate VS* used in the titration of the substance being examined,

A_s = volume in ml of 0.1M *sodium thiosulphate VS* used in the titration of the Standard Preparation

B = volume in ml of 0.1M *sodium thiosulphate VS* used in the titration of the substance being examined inactivated by the addition of 1M hydrochloric acid,

B_s = volume in ml of 0.1M *sodium* thiosulphate VS used in the titration of the Standard Preparation inactivated by the addition of 1M hydrochloric acid,

Q = potency of the Standard Preparation in Units per mg

w = total weight in mg of the substance being examined in the solution prepared for assay,

w_s = total weight in mg of the Standard Preparation in the solution prepared for assay.

Preparation

Papaveretum Injection

DEFINITION

Papaveretum is a mixture of 253 parts of Morphine Hydrochloride ($C_{17}H_{19}NO_3,HCl,3H_2O$, 375.9), 23 parts of Papaverine Hydrochloride ($C_{20}H_{21}NO_4,HCl$, 375.9) and 20 parts of Codeine Hydrochloride ($C_{18}H_{21}NO_3,HCl,2H_2O$, 371.9). It contains not less than 80.0% and not more than 88.4% of $C_{17}H_{19}NO_3,HCl$, not less than 8.3% and not more than 9.2% of $C_{20}H_{21}NO_4,HCl$ and not less than 6.6% and not more than 7.4% of $C_{18}H_{21}NO_3,HCl$, calculated with reference to the dried material.

CHARACTERISTICS

A white or almost white, crystalline powder.

Soluble in *water*; sparingly soluble in *ethanol (96%)*.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of 13.5M *ammonia,* 6 volumes of *ethanol (96%),* 40 volumes of *acetone* and 40 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µl of each of four solutions in *water* containing (1) 1.5% w/v of the substance being examined, (2) 1.28% w/v of *morphine sulphate BPCRS*, (3) 0.115% w/v of *papaverine hydrochloride BPCRS* and (4) 0.10% w/v of *codeine hydrochloride BPCRS*. After removal of the plate, dry it at 100° to 105° for 15 minutes, allow it to cool and spray with *potassium iodobismuthate solution* and then with a 0.4% v/v solution of *sulphuric acid*. The chromatogram obtained with solution (1) shows three principal spots corresponding to the principal spots in the chromatograms obtained with solutions (2), (3) and (4).

B. Yields the reactions characteristics of *chlorides*, Appendix VI.

TESTS

Acidity

pH of a 1.5% w/v solution, 3.7 to 4.7, Appendix V L.

Clarity and colour of solution

A 1.5% w/v solution in *water* is *clear*, Appendix IV A, and not more intensely coloured than *reference solution* BY_5, Appendix IV B, Method II.

Loss on drying

When dried to constant weight at 130°, loses not less than 10.0% and not more than 14.0% of its weight. Use 0.5 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using three solutions in *methanol (60%)* containing (1) 0.128% w/v of *morphine sulphate BPCRS*, 0.0115% w/v of *papaverine hydrochloride BPCRS* and 0.010% w/v of *codeine hydrochloride BPCRS*, (2) 0.128% w/v of *morphine sulphate BPCRS* and (3) 0.15% w/v of the substance being examined.

The chromatographic procedure may be carried out using a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a solution containing 0.01M *sodium acetate* and 0.005M *dioctyl sodium sulphosuccinate* in *methanol (60%)* adjusted to pH 5.5 with *glacial acetic acid* and (c) a detection wavelength of 285 nm. If necessary, adjust the proportion of methanol in the mobile phase in the range 55% v/v to 65% v/v so that the retention time of morphine in solution (2) is 4 to 5 minutes. Adjust the pH of the mobile phase with either *glacial acetic acid* or 2M *sodium hydroxide* in order to obtain optimum separation of the three principal components in solution (1). The retention times of codeine and papaverine relative to that of morphine are about 1.3 and 1.7 respectively.

For anhydrous morphine hydrochloride

Calculate the content of $C_{17}H_{19}NO_3,HCl$ using the declared content of $C_{17}H_{19}NO_3$ in *morphine sulphate BPCRS*. Each mg of $C_{17}H_{19}NO_3$ is equivalent to 1.13 mg of $C_{17}H_{19}NO_3,HCl$.

For papaverine hydrochloride

Calculate the content of $C_{20}H_{21}NO_4,HCl$ using the declared content of $C_{20}H_{21}NO_4,HCl$ in *papaverine hydrochloride BPCRS*.

For anhydrous codeine hydrochloride

Calculate the content of $C_{18}H_{21}NO_3,HCl$ using the declared content of $C_{18}H_{21}NO_3,HCl$ in *codeine hydrochloride BPCRS*.

STORAGE

Papaveretum should be protected from light.

Carry out all the operations in a penicillin-free atmosphere and with equipment reserved for this test. Sterilise the equipment at 180 °C for 3 h and the buffer solutions at 121 °C for 20 min before use.

Test solution (a). Dissolve 1.000 g in 8 ml of *buffer solution pH 2.5 R* and add 8 ml of *ether R*. Shake vigorously for 1 min. Repeat the extraction and combine the ether layers. Add 8 ml of *buffer solution pH 2.5 R.* Shake for 1 min, allow to settle and quantitatively separate the upper layer, taking care to eliminate the aqueous phase completely (penicillin is unstable at pH 2.5; carry out operations at this pH within 6-7 min). Add 8 ml of *phosphate buffer solution pH 6.0 R2* to the ether phase, shake for 5 min, allow to settle, then separate the aqueous layer and check that the pH is 6.0.

Test solution (b) To 2 ml of test solution (a) add 20 µl of *penicillinase solution R* and incubate at 37 °C for 1 h.

Reference solution (a) Dissolve 5 mg of *benzylpenicillin sodium R* in 500 ml of *phosphate buffer solution pH 6.0 R2*. Dilute 0.25 ml of the solution to 200.0 ml with *buffer solution pH 2.5 R*. Carry out the extraction using 8 ml of this solution as described for test solution (a).

Reference solution (b) To 2 ml of reference solution (a) add 20 µl of *penicillinase solution R* and incubate at 37 °C for 1 h.

Blank solution Prepare the solution as described for test solution (a) but omitting the substance to be examined.

Liquefy a suitable nutrient medium such as that described below and inoculate it at a suitable temperature with a culture of *Kocuria rhizophila* (ATCC 9341), to give 5×10^4 micro-organisms per millilitre or a different quantity if necessary to obtain the required sensitivity and formation of clearly defined inhibition zones of suitable diameter. Immediately pour the inoculated medium into 5 Petri dishes 10 cm in diameter to give uniform layers 2-5 mm deep. The medium may alternatively consist of 2 layers, only the upper layer being inoculated. Store the dishes so that no appreciable growth or death of the micro-organisms occurs before use and so that the surface of the agar is dry at the time of use. In each dish, place 5 stainless steel hollow cylinders 6 mm in diameter on the surface of the agar evenly spaced on a circle with a radius of about 25 mm and concentric with the dish. For each dish, place in separate cylinders 0.15 ml of test solutions (a) and (b), reference solutions (a) and (b) and the blank solution. Maintain at 30 °C for at least 24 h. Measure the diameters of the inhibition zones with a precision of at least 0.1 mm. The test is valid if reference solution (a) gives a clear inhibition zone and if reference solution (b) and the blank solution give no inhibition zone. If test solution (a) gives an inhibition zone, this is caused by penicillin if test solution (b) gives no inhibition zone. If this is so, the average diameter of the inhibition zones given by test solution (a) for the 5 Petri dishes is less than the average diameter of the inhibition zones given by reference solution (a) measured in the same conditions.

Mix and add 2.0 ml of *methyl isobutyl ketone R* and shake for 1 min. Dilute to 25.0 ml with *water R* and allow the 2 layers to separate; use the methyl isobutyl ketone layer.

Gastrin analogue.

Preparation

Pentagastrin Injection

DEFINITION

Pentagastrin is a pentapeptide that stimulates gastric secretion of acid. It contains not less than 97.0% and not more than 103.0% of $C_{37}H_{49}N_7O_9S$, calculated with reference to the dried substance.

CHARACTERISTICS

A white or almost white powder.

Practically insoluble in *water*; soluble in 5M *ammonia* and in *dimethylformamide*; slightly soluble in *ethanol (96%)*.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.010% w/v solution in 0.01M *ammonia* exhibits maxima at 280 nm and 288 nm and an inflection at 275 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance on each of three plates and the following solvent systems as the mobile phases: (A) a mixture of 75 volumes of *butan-2-ol* and 25 volumes of a 3% v/v solution of 13.5M *ammonia*, (B) the upper layer produced by shaking together 50 volumes of *water*, 40 volumes of *butan-1-ol* and 10 volumes of *glacial acetic acid* and allowing to separate and (C) a mixture of 50 volumes of *glacial acetic acid*, 25 volumes of *ether* and 25 volumes of *water*. Apply separately to each plate 2 µl of each of two solutions in 0.1M *ammonia* containing (1) 0.5% w/v of the substance being examined and (2) *pentagastrin BPCRS* containing 0.5% w/v of pentagastrin. After removal of the plates, allow them to dry in air, heat at 100° for 2 minutes, spray with a 1.0% w/v solution of *4-dimethylaminobenzaldehyde* in a mixture of 3 volumes of *methanol* and 1 volume of *hydrochloric acid* and heat at 100° until purple spots are produced (about 2 minutes). Examine by transmitted light. On each plate, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) .

Light absorption

Ratio of the *absorbance* of a 0.010% w/v solution in 0.01M *ammonia* at the maximum at 280 nm to that at the maximum at 288 nm, 1.12 to 1.22, Appendix II B.

Specific optical rotation

In a 1% w/v solution in *dimethylformamide*, -25.0 to -29.0, calculated with reference to the dried substance, Appendix V F.

Amino acids

β-Alanine 11.0 to 12.2%, aspartic acid 16.4 to 18.2%, methionine 18.4 to 20.4%, phenylalanine, 20.4 to 22.6%, when determined by the following method. Examine using an amino acid analyser according to the manufacturer's instructions. Standardise the apparatus with 1 mg of an equimolar mixture of β-alanine, aspartic acid, methionine and phenylalanine. Place 1 mg of the substance being examined in a rigorously cleaned hard-glass tube (10 cm × 6 mm), add not less than 0.5 ml of 6M *hydrochloric acid*, immerse the tube in a freezing mixture at -5°, evacuate to a pressure not exceeding 0.133 kPa and seal. Heat for 16 hours at 110° to 115°, cool, open the tube, transfer the contents to a 10 ml flask with the aid of five 0.2 ml quantities of *water* and evaporate to dryness over *potassium hydroxide* at a pressure of 2 kPa. Take up the residue in *water* and repeat the evaporation; repeat these operations. Dissolve the residue in a suitable buffer solution (pH 2.2) and dilute to a suitable volume with the same buffer solution. Apply an aliquot of the solution to the amino acid analyser. Choose conditions such that the peak given by the amino acid present in the largest amount produces almost maximum deflection on the chart paper.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 100 volumes of *ether*, 20 volumes of *glacial acetic acid* and 10 volumes of *water* as the mobile phase. Apply separately to the plate 10 µl of each of two solutions of the substance being examined in a mixture of 24 volumes of *methanol* and 1 volume of 13.5M *ammonia* containing (1) 0.50% w/v and (2) 0.010% w/v. After removal of the plate, allow it to dry in air, heat at 100° for 2 minutes, spray with a 1.0% w/v solution of *4-dimethylaminobenzaldehyde* in a mixture of 3 volumes of *methanol* and 1 volume of *hydrochloric acid* and heat at 100° until purple spots are produced (about 2 minutes). Examine by transmitted light. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Loss on drying

When dried over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours, loses not more than 0.5% of its weight. Use 1 g.

ASSAY

Dissolve 5 mg in sufficient 0.01M *ammonia* to produce 100 ml and measure the *absorbance* at the maximum at 280 nm, Appendix II B. Calculate the content of $C_{37}H_{49}N_7O_9S$ taking 70.0 as the value of A (1%, 1 cm) at the maximum at 280 nm.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, very soluble in water.

IDENTIFICATION

A. Dissolve 1 g in 10 ml of *water R* and add 5 ml of *dilute acetic acid R*. A white, crystalline precipitate is formed. Filter, wash the precipitate with *water R* and dry at 100 °C to 105 °C. Determine the melting point (*2.2.14*) of the precipitate. Mix equal parts of the precipitate and *pentobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 131 °C) is not greater than 2 °C.

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel* GF_{254} *plate R*.

Test solution Dissolve 25 mg of the precipitate obtained in identification test A in *alcohol R* and dilute to 25 ml with the same solvent.

Reference solution Dissolve 25 mg of *pentobarbital CRS* in *alcohol R* and dilute to 25 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. DEFINITION

Pentobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-ethyl-5-[(1*RS*)-1-methylbutyl]pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, very slightly soluble in water, freely soluble in ethanol. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

A. Determine the melting point (*2.2.14*) of the substance to be examined. Mix equal parts of the substance to be examined and *pentobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 133 °C) is not greater than 2 °C.

B. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution Dissolve 0.1 g of *pentobarbital CRS* in *alcohol R* and dilute to 100 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 10 mg add about 10 mg of *vanillin R* and 2 ml of *sulphuric acid R*. Mix and heat on a water-bath for 2 min. A reddish-brown colour develops. Cool and add cautiously 5 ml of *ethanol R*. The colour becomes violet and then blue.

TESTS

Appearance of solution

Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y6 (*2.2.2, Method II*).

Acidity

Boil 1.0 g with 50 ml of *water R* for 2 min, allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R*. The solution is orange-yellow. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to produce a pure yellow colour.

Related substances

Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Isomer

Dissolve 0.3 g in 5 ml of a 50 g/l solution of *anhydrous sodium carbonate R*, heating slightly if necessary. Add a solution of 0.3 g of *nitrobenzyl chloride R* in 10 ml of *alcohol R* and heat under a reflux condenser for 30 min. Cool to 25 °C, filter and wash the precipitate with five quantities, each of 5 ml, of *water R*. In a small flask, heat the precipitate with 25 ml of *alcohol R* under a reflux condenser until dissolved (about 10 min). Cool to 25 °C, if necessary scratching the wall of the flask with a glass rod to induce crystallisation, and filter. The precipitate, washed with two quantities, each of 5 ml, of *water R* and dried at 100 °C to 105 °C for 30 min, melts (*2.2.14*) at 136 °C to 148 °C.

Loss on drying (*2.2.32*)

Avoid shaking and foaming during preparation of the test and reference solutions.

Test solution Immediately before use, prepare a solution of the substance to be examined expected to contain 0.5 Ph. Eur. U./ml in *dilute hydrochloric acid R2*; before dilution to volume, adjust to pH 1.6 ± 0.1, if necessary, using *1 M hydrochloric acid*.

Reference solution Less than 15 min before use, prepare a solution of *pepsin powder BRP* containing 0.5 Ph. Eur. U./ml in *dilute hydrochloric acid R2*; before dilution to volume, adjust to pH 1.6 ± 0.1, if necessary, using *1 M hydrochloric acid*.

Designate tubes in duplicate T, T_b, S_1, S_{1b}, S_2, S_{2b}, S_3, S_{3b}; designate a tube B.

Add *dilute hydrochloric acid R2* to the tubes as follows:

B: 1.0 ml

S_1 and S_{1b}: 0.5 ml

S_2, S_{2b} and T and T_b: 0.25 ml

Add the reference solution to the tubes as follows:

S_1 and S_{1b}: 0.5 ml

S_2 and S_{2b}: 0.75 ml

S_3 and S_{3b}: 1.0 ml

Add 0.75 ml of the test solution to tubes T and T_b.

Add 10.0 ml of *trichloroacetic acid solution R* to tubes S_{1b}, S_{2b}, S_{3b}, T_b and B. Mix by shaking.

Place the tubes and *haemoglobin solution R* in a water bath at 25 ± 0.1 °C. When temperature equilibrium is reached, add 5.0 ml of *haemoglobin solution R* to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix.

At time zero add 5.0 ml of *haemoglobin solution R* successively and at intervals of 30 s to tubes S_1, S_2, S_3 and T.

Mix immediately after each addition.

Exactly 10 min after adding the *haemoglobin solution R*, stop the reaction by adding, at intervals of 30 s, 10.0 ml of *trichloroacetic acid solution R* to tubes S_1, S_2, S_3 and T (the use of a fast-flowing or blow-out pipette is recommended) and mix.

Filter the contents of each tube (samples and blanks) twice through the same suitable filter paper previously washed with a 50 g/l solution of *trichloroacetic acid R,* then with *water R* and dried. Discard the first 5 ml of filtrate. Place 3.0 ml of each filtrate separately in a tube containing 20 ml of *water R*. Mix.

A suitable filter paper complies with the following test: filter 5 ml of a 50 g/l solution of *trichloroacetic acid R* through a 7 cm disc of white filter paper: the absorbance (*2.2.25*) of the filtrate, measured at 275 nm using unfiltered *trichloroacetic acid R* solution as the compensation liquid, is less than 0.04.

Add to each tube 1.0 ml of *sodium hydroxide solution R* and 1.0 ml of *phosphomolybdotungstic reagent R*, beginning with the blanks and then the samples of each set, in a known order.

A schematic presentation of the above operations is shown in Table 0682.-1.

After 15 min measure the absorbance (*2.2.25*) of solutions S_1, S_2, S_3, S_{1b}, S_{2b}, S_{3b} and T at 540 nm using the filtrate obtained from tube B as the compensation liquid. Correct the average absorbance values for the filtrates obtained from tubes S_1, S_2 and S_3 by subtracting the average values obtained for the filtrates from tubes S_{1b}, $S2_b$, S_{3b} respectively.

Draw a calibration curve of the corrected values against volume of reference solution used. Determine the activity of the substance to be examined using the corrected absorbance for the test solution ($T - T_b$) together with the calibration curve and taking into account the dilution factors.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

A. Melting point (*2.2.14*): 96 °C to 100 °C.

B. Dissolve 10 mg in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *methanol R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows two absorption maxima, at 257 nm and 313 nm. The ratio of the absorbance measured at the maximum at 313 nm to that measured at the maximum at 257 nm is 0.120 to 0.128.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *perphenazine CRS* . Examine the substances prepared as discs.

D. Examine by thin-layer chromatography (*2.2.27*), using *kieselguhr G R* as the coating substance. When the impregnation mixture has risen at least 17 cm from the lower edge of the plate, remove the plate and use immediately for chromatography. Carry out the chromatography in the same direction as the impregnation.

Test solution Dissolve 20 mg of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution Dissolve 20 mg of *perphenazine CRS* in *chloroform R* and dilute to 10 ml with the same solvent.

$C_4H_{10}N_2,H_3PO_4,H_2O$ 202.1 *18534-18-4*

Action and use

Anthelminthic.

Preparation

Piperazine Phosphate Tablets

DEFINITION

Piperazine Phosphate contains not less than 98.5% and not more than 100.5% of $C_4H_{10}N_2$, H_3PO_4, calculated with reference to the anhydrous substance.

CHARACTERISTICS

A white, crystalline powder; odourless or almost odourless.

Sparingly soluble in *water*; practically insoluble in *ethanol (96%)*.

IDENTIFICATION

A. Dissolve 0.1 g in 5 ml of *water*, add 0.5 g of *sodium hydrogen carbonate*, 0.5 ml of a 5% w/v solution of *potassium hexacyanoferrate(III)* and 0.1 ml of *mercury*. Shake vigorously for 1 minute and allow to stand for 20 minutes. A reddish colour is produced slowly.

B. Dissolve 0.2 g in 5 ml of 2M *hydrochloric acid*, add with stirring 1 ml of a 50% w/v solution of *sodium nitrite* and cool in ice for 15 minutes, stirring if necessary to induce crystallisation. The *melting point* of the crystals, after washing with 10 ml of iced *water* and drying at 105°, is about 159°, Appendix V A.

C. A solution yields the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Acidity

pH of a 1% w/v solution, 6.0 to 6.5, Appendix V L.

Heavy metals

Dissolve 2.0 g in 20 ml of 2M *acetic acid*. 12 ml of the resulting solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (2 ppm Pb)* to prepare the standard (20 ppm).

Water

8.0 to 9.5% w/w, Appendix IX C. Use 0.25 g.

ASSAY

Dissolve 0.2 g in a mixture of 3.5 ml of 0.5M *sulphuric acid* and 10 ml of *water*. Add 100 ml of *picric acid solution R1*, heat on a water bath for 15 minutes and allow to stand for 1 hour. Filter through a sintered-glass filter (ISO 4793, porosity grade 4, is suitable) and wash the residue with successive 10 ml quantities of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five 10 ml quantities of *absolute ethanol* and dry to constant weight at 100° to 105°. Each g of residue is equivalent to 0.3382 g of $C_4H_{10}N_2,H_3PO_4$.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for poly(vinyl acetate) dispersion 30 per cent used in the manufacture of modified-release dosage forms and to mask taste.

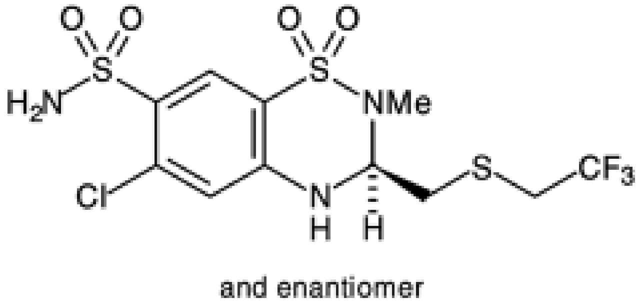
Polythiazide

General Notices



$C_{11}H_{13}ClF_3N_3O_4S_3$ 439.9 *346-18-9*

Action and use

Thiazide diuretic.

Preparation

Polythiazide Tablets

DEFINITION

Polythiazide is (*RS*)-3,4-dihydro-2-methyl-3-(2,2,2-trifluoroethylthiomethyl)-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide. It contains not less than 97.0% and not more than 102.0% of $C_{11}H_{13}ClF_3N_3O_4S_3$, calculated with reference to the dried substance.

CHARACTERISTICS

A white or almost white, crystalline powder.

Practically insoluble in *water*; sparingly soluble in *ethanol (96%)*.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of polythiazide *(RS 280)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.002% w/v solution in *methanol* exhibits a maximum at 268 nm and a less well-defined maximum at 317 nm. The *absorbance* at 268 nm is about 1.0.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of 50 volumes of *toluene*, 30 volumes of *ether* and 20 volumes of *acetone* as the mobile phase. Apply separately to the plate 20 µl of each of two solutions in *methanol* containing (1) 0.02% w/v of the substance being examined and

(2) 0.02% w/v of *polythiazide BPCRS*. After removal of the plate, allow it to dry in air until the solvent has evaporated, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again. The principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *methanol* and 90 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µl of solution (1) and quantities of 1, 2, 3, 4 and 5 µl of solution (2). Solutions (1) and (2) are solutions of the substance being examined in *acetone* containing (1) 1.0% w/v and (2) 0.020% w/v. After removal of the plate, allow it to dry in air and reveal the spots using *Method I*. Assess the intensity of any *secondary spot* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with the applications of solution (2). The sum of the intensities so assessed does not exceed 3% and no such spot is more intense than the spot in the chromatogram obtained with 5 µl of solution (2) (2%).

Loss on drying

When dried to constant weight at 105°, loses not more than 1.0% of its weight. Use 1 g.

Sulphated ash

Not more than 0.1%, Appendix IX A.

ASSAY

Dissolve 0.1 g in sufficient *methanol* to produce 250 ml, dilute 5 ml to 200 ml with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 268 nm, Appendix II B. Calculate the content of $C_{11}H_{13}ClF_3N_3O_4S_3$ taking 500 as the value of A(1%, 1 cm) at the maximum at 268 nm.

Potassium Hydroxyquinoline Sulphate

General Notices

Action and use

Used in treatment of acne.

Preparation

Potassium Hydroxyquinoline Sulphate and Benzoyl Peroxide Cream.

DEFINITION

Potassium Hydroxyquinoline Sulphate is an equimolecular mixture of quinolin-8-ol sulphate monohydrate, $(C_9H_7NO)_2,H_2SO_4,H_2O$, and potassium sulphate, K_2SO_4. It contains not less than 50.6% and not more than 52.6% of quinolin-8-ol, C_9H_7NO, and not less than 29.5% and not more than 32.5% of K_2SO_4, calculated with reference to the anhydrous substance.

CHARACTERISTICS

A pale yellow, microcrystalline powder. It partly liquefies between 172° and 184°.

Freely soluble in *water*; insoluble in *ether*. On extraction with hot *absolute ethanol* a residue of potassium sulphate and a solution of quinolin-8-ol sulphate are obtained.

IDENTIFICATION

A. To 5 ml of a 5% w/v solution add drop wise, with shaking, 5M *sodium hydroxide* until a heavy precipitate is produced. Filter, wash with *water* and dry at a pressure not exceeding 0.7 kPa for 3 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of quinolin-8-ol *(RS 310)*.

B. To 5 ml of a 5% w/v solution add 0.5 ml of *iron(III) chloride solution R1*. A dark green colour is produced.

C. Yields reaction A characteristic of *potassium salts*, Appendix VI.

D. Yields reaction A characteristic of *sulphates*, Appendix VI.

TESTS

Water

Not more than 5.0% w/w, Appendix IX C. Use 0.5 g.

ASSAY

For quinolin-8-ol

Dissolve 0.35 g in 50 ml of *water* and 20 ml of *hydrochloric acid*, add 50 ml of 0.05M *bromine VS*, stopper the flask and shake for 15 minutes. Allow to stand for 15 minutes, add 80 ml of *water* and 10 ml of *dilute potassium iodide solution* and titrate with 0.1M *sodium thiosulphate*

VS using *starch mucilage*, added towards the end of the titration, as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of bromine required. Each ml of 0.05M *bromine VS* is equivalent to 3.629 mg of C_9H_7NO.

For potassium sulphate

Prepare a solution of suitable concentration with *water*. Carry out the method for *atomic emission spectrophotometry*, Appendix II D, measuring at 766.5 nm and using *potassium standard solution (600 ppm K)*, suitably diluted with *water*, to prepare the standard solutions. Each mg of potassium is equivalent to 2.2284 mg of K_2SO_4.

Nessler cylinder and acidify with 6 ml of *nitric acid*. After 5 minutes, any opalescence, when viewed vertically, is not greater than that produced by treating 5 ml of a 0.00165% w/v solution of *sodium chloride* at the same time and in the same manner (0.02%).

Iodide

Add 1 ml of 1.8M *sulphuric acid* to 25 ml of solution S1 and shake with 1 ml of *chloroform*. Any violet colour produced is not more intense than that of a solution prepared at the same time and in the same manner but using 5 ml of solution S1 and 2 ml of *iodide standard solution (10 ppm I)* (20 ppm).

Close the flask and stand in the dark for 5 minutes. Titrate the solution with 0.1M *sodium thiosulphate VS* to a light straw colour and then complete the titration to a colourless end point using *starch mucilage* as indicator. Each ml of 0.1M *sodium thiosulphate VS* is equivalent to 3.567 mg of KIO_3.

D. To 2 ml of *sulphuric acid R* add about 2 mg and shake to dissolve. Within 5 min, an intense red colour develops. When examined in ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add this solution to 10 ml of *water R* and mix. The colour fades and there is a greenish-yellow fluorescence in ultraviolet light at 365 nm.

E. To about 40 mg add 2 ml of *sulphuric acid R* and heat gently until white fumes are evolved. Add *nitric acid R* dropwise, continue the heating until the solution is almost colourless, and cool. Add 2 ml of *water R*, heat until white fumes are again evolved, cool, add 10 ml of *water R* and neutralise to *red litmus paper R* with *dilute ammonia R1*. The solution gives reaction (a) of sodium (*2.3.1*) and reaction (b) of phosphates (*2.3.1*).

Test solution (b) Dilute 2.0 ml of test solution (a) to 3.0 ml with *water R*.

Test solution (c) Dilute 1.0 ml of test solution (a) to 3.0 ml with *water R*.

Use as titrant a 1 to 6 dilution of *heparin sodium BRP* in *water R* (for example, 1.7 ml diluted to 10.0 ml with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable colorimeter and set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range. Add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. For each individual titration, calculate the number of International Units of heparin in the volume of titrant added at the end-point per milligram of the substance to be examined. Calculate the potency of the substance as the average of the 18 values. Test the linearity of the response by the usual statistical methods. Calculate the 3 standard deviations for the results obtained with each of the 3 test solutions. Calculate the 3 standard deviations for the results obtained with each of the 3 independent assays. The assay is not valid unless each of the 6 standard deviations is less than 5 per cent of the average result.

Pyroxylin

General Notices

Cellulose Nitrate

Preparation

Flexible Collodion

DEFINITION

Pyroxylin is a nitrated cellulose obtained by the action of a mixture of nitric and sulphuric acids on wood pulp or cotton linters that have been freed from fatty matter. It must be damped with not less than 25% by weight of Isopropyl Alcohol or of Industrial Methylated Spirit.

CAUTION *Compliance is required with the provisions of relevant legislation relating to the storage of, use of and containers used for Pyroxylin*.

In the following tests, particular care should be exercised when drying pyroxylin. The material so obtained is explosive and sensitive to ignition by impact or friction and it should be handled as carefully as possible.

CHARACTERISTICS

White or almost white, cuboid granules or fibrous material, the latter resembling absorbent cotton but harsher to the touch and more powdery. Both the granules and the fibrous material appear moist. Highly flammable.

Soluble in *glacial acetic acid* and in *acetone*.

IDENTIFICATION

Add *water* to a solution in *acetone*. A white, viscid mass is readily precipitated.

TESTS

Clarity and colour of solution

A 10% w/v solution dissolves at 20° in a mixture of 1 volume of *ethanol (90%)* and 3 volumes of *ether* to produce an almost clear and colourless to pale straw-coloured solution.

Kinematic viscosity

1160 to 2900 mm^2s^{-1} when determined in the following manner. To 20 g, previously dried to constant weight by heating on a water-bath at 80° and allowing to cool in a desiccator over *silica gel*, add 200 ml of a mixture of 19 volumes of *acetone* and 1 volume of *water*. Shake vigorously to prevent the formation of aggregates of partly solvated pyroxylin and rotate suitably to obtain a homogeneous solution. Measure the viscosity of the solution within 48 hours using a falling sphere viscometer complying with British Standard 188: 1977 (Methods for the determination of viscosity of liquids). Fill the fall tube with the solution being examined to about 10 mm above the 220-mm mark, place vertically in the bath and allow to stand for air bubbles to clear and for temperature equilibrium to be attained. Clean the sphere, immerse it in a portion of the liquid being examined maintained at a temperature of 19.9° to 20.1° and when it is at this temperature introduce it, without wiping, into the delivery tube. Observe the time for the lowest part of the sphere to pass through the planes of the tops of the 175-mm mark and the 25-mm mark, using a telescope or other suitable device to avoid errors due to parallax. The average of three readings concordant to within 0.5% is taken as the time of fall. Calculate the kinematic viscosity (ν) in square millimetres per second (mm^2s^{-1}) from the expression:

$$\nu = \frac{d^2 g(\delta - \rho)}{0.18 v \rho} \times 0.867$$

where d = the diameter of the sphere in cm,

δ = density of the sphere in g cm^{-3},

ρ = density of the liquid being tested in g cm^{-3},

v = velocity of fall in cm s^{-1},

g = local acceleration due to gravity in cm s^{-2}.

Nitrogen

11.7 to 12.2%, calculated with reference to the material dried to constant weight by heating on a water-bath at 80° and allowing to cool in a desiccator over silica gel, when determined by the following method. Transfer 0.4 g of the dried substance to a 750 ml round-bottomed flask using 60 ml of *water*, add 20 ml of *hydrogen peroxide solution (20 vol)* and then add slowly, with shaking, 50 ml of a 30% w/w solution of *potassium hydroxide* and 5 ml of *ethanol (96%)*. Agitate slowly for 3 hours or until the substance being examined has dissolved. Add 3 g of *Devarda's alloy* and immediately connect the flask to the spray trap of an ammonia-distillation apparatus, the receiver of which contains 50 ml of 0.1M *hydrochloric acid VS* and 0.15 ml of *methyl red solution*. Allow the reaction to proceed until no further evolution of gas occurs and then heat the contents of the flask to boiling and distil carefully until 30 ml remains in the round-bottomed flask. Rinse the delivery tube into the receiver with *water* and titrate the combined distillate and rinsings with 0.1M *sodium hydroxide VS*. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of acid required to neutralise the ammonia formed. Each ml of 0.1M *hydrochloric acid VS* is equivalent to 1.401 mg of nitrogen.

STORAGE

Pyroxylin should be loosely packed, protected from light and stored at a temperature not exceeding 15°, remote from fire. The container should be suitably designed to disrupt should the internal pressure reach or exceed 1400 kPa. The amount of damping fluid must not be allowed to fall below 25% w/w; should this happen, the material should be either rewetted or used immediately for the preparation of Collodion.

Quinine Dihydrochloride Intravenous Infusion

DEFINITION

Quinine Dihydrochloride is (8*S*,9*R*)-6′-methoxycinchonan-9-ol dihydrochloride. It contains not less than 99.0% and not more than 101.0% of alkaloid dihydrochlorides, calculated as $C_{20}H_{24}N_2O_2,2HCl$, with reference to the dried substance.

CHARACTERISTICS

A white or almost white powder.

Very soluble in *water*; soluble in *ethanol (96%)*.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 15 volumes of *diethylamine*, 36 volumes of *ether* and 60 volumes of *toluene* as the mobile phase. Apply separately to the plate 4 µl of each of three solutions in *methanol* containing (1) 1.0% w/v of the substance being examined, (2) 1.0% w/v of *quinine sulphate EPCRS* and (3) 1.0% w/v each of *quinidine sulphate EPCRS* and *quinine sulphate EPCRS*. After removal of the plate, dry it in a current of air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow it to cool and spray with *iodoplatinate reagent*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. Complies with the test for Acidity.

C. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Acidity

pH of a 3% w/v solution, 2.0 to 3.0, Appendix V L.

Specific optical rotation

In a 3% w/v solution in 0.1M *hydrochloric acid*, -223 to -229 calculated with reference to the dried substance, Appendix V F.

To 15 ml of a 2.0% w/v solution add 1 ml of 1M *sulphuric acid*. The solution remains clear for at least 15 minutes.

Sulphate

Other cinchona alkaloids

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 20 mg of the substance being examined, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase. Prepare solutions (2) and (3) in the same manner using *quinine sulphate EPCRS* and *quinidine sulphate EPCRS* respectively in place of the substance being examined. Solution (4) is a mixture of equal volumes of solutions (2) and (3). For solution (5) dilute 1 volume of solution (2) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase. Solution (6) contains 0.10% w/v of *thiourea* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS 5 µm is suitable), (b) as the mobile phase with a flow rate of 1.5 ml per minute a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with 1M *orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water* and (c) a detection wavelength of 250 nm for recording the chromatogram obtained with solution (6) and 316 nm for the other solutions.

Inject separately 10 µl of each of solutions (3) and (6). If necessary adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with solution (3) the *capacity factor* of the peak due to quinidine is 3.5 to 4.5, V_O being calculated from the peak due to thiourea in the chromatogram obtained with solution (6). Inject 10 µl of each of solutions (2), (3), (4) and (5). The chromatogram obtained with solution (2) shows a principal peak due to quinidine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with solution (3) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with solution (4) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solutions (2) and (3).

The test is not valid unless (a) in the chromatogram obtained with solution (4) the *resolution factor* between the peaks due to quinine and quinidine is at least 1.5 and the *resolution factor* between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the *signal-to-noise ratio* of the principal peak in the chromatogram obtained with solution (5) is at least 5.

Inject 10 µl of solution (1) and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by *normalisation*, disregarding any peaks the areas of which are less than that of the peak in the chromatogram obtained with solution (5). The content of dihydroquinine is not greater than 10%, the content of any related substance eluting before quinine is not more than 5% and the content of any other related substance is not more than 2.5%.

When dried to constant weight at 105°, loses not more than 3.0% of its weight. Use 1 g.

Sulphated ash

Not more than 0.1%, Appendix IX A.

Titratable cation

79.7 to 84.2%, calculated with reference to the dried substance, when determined by the following method. Dissolve 0.4 g in 10 ml of *water*, add 40 ml of *methanol* and titrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each ml of 0.1M *sodium hydroxide VS* is equivalent to 16.32 mg of $[C_{20}H_{26}N_2O_2]^{2+}$.

ASSAY

Dissolve 0.3 g in a mixture of 50 ml of *anhydrous acetic acid* and 20 ml of *acetic anhydride*, add 10 ml of *mercury(II) acetate solution* and carry out method I for *non-aqueous titration*, Appendix VIII A, using crystal violet solution as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 19.87 mg of $C_{20}H_{24}N_2O_2$,2HCl.

Products of Recombinant DNA Technology

General Notices

(Ph Eur monograph 0784)

Ph Eur

This monograph provides general requirements for the development and manufacture of products of recombinant DNA technology. These requirements are not necessarily comprehensive in a given case and requirements complementary or additional to those prescribed in this monograph may be imposed in an individual monograph or by the competent authority.

The monograph is not applicable to modified live organisms that are intended to be used directly in man and animals, for example as live vaccines.

DEFINITION

Products of rDNA technology are produced by genetic modification in which DNA coding for the required product is introduced, usually by means of a plasmid or a viral vector, into a suitable micro-organism or cell line, in which that DNA is expressed and translated into protein. The desired product is then recovered by extraction and purification. The cell or micro-organism before harbouring the vector is referred to as the host cell, and the stable association of the two used in the manufacturing process is referred to as the host-vector system.

PRODUCTION

Production is based on a validated seed-lot system using a host-vector combination that has been shown to be suitable to the satisfaction of the competent authority. The seed-lot system uses a master cell bank and a working cell bank derived from the master seed lot of the host-vector combination. A detailed description of cultivation, extraction and purification steps and a definition of the production batch shall be established.

Where products of rDNA technology are manufactured using materials of human or animal origin, the requirements of chapter *5.1.7*. *Viral safety* apply.

The determination of the suitability of the host-vector combination and the validation of the seed-lot system include the following elements.

CLONING AND EXPRESSION

The suitability of the host-vector system, particularly as regards microbiological purity, is demonstrated by:

Characterisation of the host cell, including source, phenotype and genotype, and of the cell-culture media;

Documentation of the strategy for the cloning of the gene and characterisation of the recombinant vector, including:

i. the origin and characterisation of the gene;

ii. nucleotide-sequence analysis of the cloned gene and the flanking control regions of the expression vector; the cloned sequences are kept to a minimum and all relevant expressed sequences are clearly identified and confirmed at the RNA level; the DNA sequence of the cloned gene is normally confirmed at the seed-lot stage, up to and beyond the normal level of population doubling for full-scale fermentation; in certain systems, for example, where multiple copies of the gene are inserted into the genome of a continuous cell line, it may be inappropriate to sequence the cloned gene at the production level; under these circumstances, Southern blot analysis of total cellular DNA or sequence analysis of the messenger RNA (mRNA) may be helpful, particular attention being paid to the characterisation of the expressed protein;

iii. the construction, genetics and structure of the complete expression vector;

Characterisation of the host-vector system, including:

i. mechanism of transfer of the vector into the host cells;

ii. copy number, physical state and stability of the vector inside the host cell;

iii. measures used to promote and control the expression.

CELL-BANK SYSTEM

The master cell bank is a homogeneous suspension of the original cells already transformed by the expression vector containing the desired gene, distributed in equal volumes into individual containers for storage (for example, in liquid nitrogen). In some cases it may be necessary to establish separate master cell banks for the expression vector and the host cells.

The working cell bank is a homogeneous suspension of the cell material derived from the master cell bank(s) at a finite passage level, distributed in equal volumes into individual containers for storage (for example, in liquid nitrogen).

In both cell banks, all containers are treated identically during storage and, once removed from storage, the containers are not returned to the cell stock.

The cell bank may be used for production at a finite passage level or for continuous-culture production.

Production at a finite passage level This cultivation method is defined by a limited number of passages or population doublings which must not be exceeded during production. The maximum number of cell doublings, or passage levels, during which the manufacturing process routinely meets the criteria described below must be stated.

Continuous-culture production By this cultivation method the number of passages or population doublings is not restricted from the beginning of production. Criteria for the harvesting as well as for the termination of production have to be defined by the manufacturer. Monitoring is necessary throughout the life of the culture; the required frequency and type of monitoring will depend on the nature of the production system and the product.

Information is required on the molecular integrity of the gene being expressed and on the phenotypic and genotypic characteristics of the host cell after long-term cultivation. The acceptance of harvests for further processing must be clearly linked to the schedule of monitoring applied and a clear definition of a 'batch' of product for further processing is required.

VALIDATION OF THE CELL BANKS

Validation of the cell banks includes:

i. stability by measuring viability and the retention of the vector;

ii. identity of the cells by phenotypic features;

iii. where appropriate, evidence that the cell banks are free from potentially oncogenic or infective adventitious agents (viral, bacterial, fungal or mycoplasmal); special attention has to be given to viruses that can commonly contaminate the species from which the cell line has been derived; certain cell lines contain endogenous viruses, for example, retroviruses, which may not readily be eliminated; the expression of these organisms, under a variety of conditions known to cause their induction, shall be tested for;

iv. for mammalian cells, details of the tumorigenic potential of the cell bank shall be obtained.

CONTROL OF THE CELLS

The origin, form, storage, use and stability at the anticipated rate of use must be documented in full for all cell banks under conditions of storage and recovery. New cell banks must be fully validated.

VALIDATION OF THE PRODUCTION PROCESS

Extraction and purification

The capacity of each step of the extraction and purification procedure to remove and/or inactivate contaminating substances derived from the host cell or culture medium, including, in particular, virus particles, proteins, nucleic acids and added substances, must be validated.

Validation studies are carried out to demonstrate that the production process routinely meets the following criteria:

— exclusion of extraneous agents from the product; studies including, for example, viruses with relevant physico-chemical features are undertaken, and a reduction capacity for such contaminants at each relevant stage of purification is established;

— adequate removal of vector, host-cell, culture medium and reagent-derived contaminants from the product; the reduction capacity for DNA is established by spiking; the reduction of proteins of animal origin can be determined by immunochemical methods;

— maintenance within stated limits of the yield of product from the culture;

— adequate stability of any intermediate of production and/or manufacturing when it is intended to use intermediate storage during the process.

Characterisation of the substance

The identity, purity, potency and stability of the final bulk product are established initially by carrying out a wide range of chemical, physical, immunochemical and biological tests. Prior to release, each batch of the product is tested by the manufacturer for identity and purity and an appropriate assay is carried out.

Production consistency

Suitable tests for demonstrating the consistency of the production and purification are performed. In particular, the tests include characterisation tests, in-process controls and final-product tests as exemplified below.

AMINO-ACID COMPOSITION

Partial amino-acid sequence analysis The sequence data permit confirmation of the correct *N*-terminal processing and detection of loss of the *C*-terminal amino acids.

Peptide mapping Peptide mapping using chemical and/or enzymatic cleavage of the protein product and analysis by a suitable method such as two-dimensional gel electrophoresis, capillary electrophoresis or liquid chromatography must show no significant difference between the test protein and the reference preparation. Peptide mapping can also be used to demonstrate correct disulphide bonding.

DETERMINATION OF MOLECULAR MASS

Cloned-gene retention The minimum percentage of cells containing the vector or the cloned gene after cultivation is approved by the relevant authority.

Total protein The yield of protein is determined.

Chemical purity The purity of the protein product is analysed in comparison with a reference preparation by a suitable method such as liquid chromatography, capillary electrophoresis or sodium dodecyl sulphate polyacrylamide gel electrophoresis.

Host-cell-derived proteins Host-cell-derived proteins are detected by immunochemical methods, using, for example, polyclonal antisera raised against protein components of the host-vector system used to manufacture the product, unless otherwise prescribed. The following types of procedure may be used: liquid-phase displacement assays (for example, radio-immunoassay), liquid-phase direct-binding assays and direct-binding assays using antigens immobilised on nitrocellulose (or similar) membranes (for example, dot-immunoblot assays, Western blots). General requirements for the validation of immunoassay procedures are given under *2.7.1. Immunochemical Methods*. In addition, immunoassay methods for host-cell contaminants meet the following criteria.

— *Antigen preparations*. Antisera are raised against a preparation of antigens derived from the host organism, into which has been inserted the vector used in the manufacturing process that lacks the specific gene coding for the product. This host cell is cultured, and proteins are extracted, using conditions identical to those used for culture and extraction in the manufacturing process. Partly purified preparations of antigens, using some of the purification steps in the manufacturing process, may also be used for the preparation of antisera.

— *Calibration and standardisation*. Quantitative data are obtained by comparison with dose-response curves obtained using standard preparations of host-derived protein antigens. Since these preparations are mixtures of poorly defined proteins, a standard preparation is prepared and calibrated by a suitable protein determination method. This preparation is stored in a stable state suitable for use over an extended period of time.

— *Antisera*. Antisera contain high-avidity antibodies recognising as many different proteins in the antigen mixture as possible, and do not cross-react with the product.

Host-cell- and vector-derived DNA Residual DNA is detected by hybridisation analysis, using suitably sensitive, sequence-independent analytical techniques or other suitably sensitive analytical techniques.

Hybridisation analysis

DNA in the test sample is denatured to give single-stranded DNA, immobilised on a nitrocellulose or other suitable filter and hybridised with labelled DNA prepared from the host-vector manufacturing system (DNA probes). Although a wide variety of experimental approaches is available, hybridisation methods for measurement of host-vector DNA meet the following criteria.

— *DNA probes*. Purified DNA is obtained from the host-vector system grown under the same conditions as those used in the manufacturing process. Host chromosomal DNA and vector DNA may be separately prepared and used as probes.

— *Calibration and standardisation*. Quantitative data are obtained by comparison with responses obtained using standard preparations. Chromosomal DNA probes and vector DNA probes are used with chromosomal DNA and vector DNA standards, respectively. Standard preparations are calibrated by spectroscopic measurements and stored in a state suitable for use over an extended period of time.

— *Hybridisation conditions*. The stringency of hybridisation conditions is such as to ensure specific hybridisation between probes and standard DNA preparations and the drug substances must not interfere with hybridisation at the concentrations used.

Sequence-independent techniques

Suitable procedures include: detection of sulphonated cytosine residues in single-stranded DNA (where DNA is immobilised on a filter and cytosines are derivatised *in situ*, before detection and quantitation using an antibody directed against the sulphonated group); detection of single-stranded DNA using a fragment of single-stranded DNA bound to a protein and an antibody of this protein. Neither procedure requires the use of specific host or vector DNA as an assay standard. However, the method used must be validated to ensure parallelism with the DNA standard used, linearity of response and non-interference of either the drug substance or excipients of the formulation at the dilutions used in the assay.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable), (b) as the mobile phase with a flow rate of 2 ml per minute a mixture of a solution containing 6.6 g of *diammonium hydrogen orthophosphate* and 1.1 g of *sodium heptanesulphonate* in 700 ml of *water* and 300 ml of *methanol*; the mixture adjusted to pH 3.0 with an 85% v/v solution of *orthophosphoric acid* and (c) a detection wavelength of 214 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks (ritodrine and the *threo*-diastereoisomer) is at least 1.5.

In the chromatogram obtained with solution (1), identify any peaks corresponding to tyramine (relative retention time to ritodrine, 0.3), 'hexahydroketone II' (0.65), 'hexahydroketone I' (0.85), *threo*-diastereoisomer (1.15) and 'aminoketone' (2.3). In the chromatogram obtained with solution (1), (a) the area of any peak corresponding to hexahydroketone II is not greater than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3% [response relative to ritodrine 0.35]), (b) the areas of any peaks corresponding to tyramine and aminoketone are not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2% each), (c) the area of any peak corresponding to hexahydroketone I is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4% [response relative to ritodrine 0.5]), (d) the area of any peak corresponding to the *threo*-diastereoisomer is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4%) and (e) the area of any other *secondary peak* is not greater than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light, air, oxidising agents, oxidation catalysts (e.g. copper , iron), acids and prolonged heat; use freshly prepared solutions. If partial crystallisation has occurred, homogenise the material at a temperature of about 65 ‘C, but avoid prolonged heating.

Dissolve 25-100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10-15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_{λ}/A_{326} for each wavelength.

If the ratios do not exceed: 0.60 at 300 nm, 0.54 at 350 nm, 0.14 at 370 nm, calculate the content of vitamin A in International Units per gram using the following expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the preparation to be examined, in grams,

V = total volume to which the preparation to be examined is diluted to give 10-15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

If one or more of the ratios A_{λ}/A_{326} exceeds the values given, or if the wavelength of the absorption maximum does not lie between 325 nm and 327 nm, use Method B.

Ph Eur

Hydrophobic Colloidal Anhydrous Silica

General Notices

(Ph Eur monograph 2208)

Ph Eur

DEFINITION

Colloidal silicon dioxide partly alkylated for hydrophobation.

Content

99.0 per cent to 101.0 per cent SiO_2 (ignited substance).

CHARACTERS

Appearance

Light, fine, white or almost white, amorphous powder, not wettable by water.

Solubility

Practically insoluble in water and mineral acids except hydrofluoric acid. It dissolves slowly in hot solutions of alkali hydroxides.

IDENTIFICATION

A. About 25 mg ignited at 900 ± 50 °C in a platinum crucible for 2 h gives the reaction of silicates *(2.3.1)*.

B. Water-dispersible fraction (see Tests).

TESTS

Chlorides *(2.4.4)*

Maximum 250 ppm.

To 1.0 g add 30 ml of *methanol R* and 20 ml of *dilute nitric acid R*. Heat on a water-bath for 15 min stirring frequently. Cool, dilute to 50 ml with *water R* and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*.

Heavy metals *(2.4.8)*

Maximum 25 ppm.

Suspend 2.5 g in 30 ml of *methanol R*, stir and add 30 ml of *dilute ammonia R1*. With frequent stirring evaporate on a water-bath and dry the residue in an oven at 140 °C. When the dried substance is white, break up the mass with a glass rod. Reduce the residue to a powder and add 15 ml of *methanol R* and 25 ml of *1 M hydrochloric acid*. Boil gently for 5 min, stirring frequently with the glass rod. Centrifuge for 20 min and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R* and boil. Centrifuge for 20 min and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water R*, combine the filtrates and washings and dilute to 50 ml with *water R*. To 20 ml of this solution add 50 mg of *ascorbic acid R* and 1 ml of *concentrated ammonia R*. Neutralise with *dilute ammonia R2*. Dilute to 25 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water-dispersible fraction

Maximum 3.0 per cent.

Place 0.400 g in a 500 ml separating funnel, add 100 ml of *water R* and shake for 1 min. Allow to stand for 1 h. Allow 90 ml of the aqueous phase to run out dropwise without filtration into a suitable dish dried at 140 °C and cooled in a desiccator. Evaporate to dryness at 140 °C, starting at a low temperature to avoid splashing. Cool in a desiccator. The residue weighs a maximum of 12 mg.

Loss on ignition

Maximum 6.0 per cent, determined on 0.200 g by ignition in a platinum crucible at 900 ± 50 °C for 2 h. It is advisable to place the crucible in a cold oven and then to heat up the oven. Allow to cool in a desiccator before weighing.

ASSAY

To the residue obtained in the test for loss on ignition add sufficient *ethanol (96 per cent) R* to moisten the residue completely and 0.2 ml of *sulphuric acid R*. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness on a hot-plate at about 100 C, taking care to avoid loss from sputtering. Wash down the sides of the platinum crucible with 6 ml of *hydrofluoric acid R* and evaporate to dryness. Ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh.

The difference between the mass of the residue obtained in the test for loss on ignition and the mass of the final residue gives the amount of SiO_2 in the quantity of the substance to be examined.
